Copyright & Disclaimer

Before proceeding with this tutorial, you should have a basic understanding of testing concepts.

## **P**requisites

This tutorial is designed for software programmers/testers, who want to learn the basics of Robot Framework understanding on various functionalities of Robot Framework with suitable examples.

---

**Audience**

**Robot Framework** is an open source test automation framework for acceptance testing and acceptance test-driven development. It follows different test case styles - Keyword-driven, behaviou-driven and data-driven for writing test cases. This feature makes it very easy to understand and re-use driven for writing test cases.

## About the Tutorial

Robot

4		
5		
6		
7		

Now, we will write test cases, which will take different email id and password details to the template created.

## Data driven test cases

Robot framework supports keyword driven style test cases and data driven style. Data driven works with high-level keyword used as a template to the test suite and the test cases are used to share data with the high-level keyword defined in the template. It makes the work very easy for testing UI with different inputs.

## Test Case Tagging

Robot framework allows to tag test-cases so that we can either run the tags test-cases or skip the tagged testcases. Tagging helps when we want to run only a group of test cases or skip them.

## Reports and Logs

Robot framework provides all the details of test suite, test case execution in the form of report and logs. All the execution details of the test case are available in the log file. The details like whether the test case has failed or passed, time taken for execution, steps followed to run the test case are provided.

## RIDE

This editor available with Robot framework helps in writing and running test cases. The editor is very easy to install and use. RIDE makes life easy for writing test cases by providing framework specific code completion, syntax highlighting, etc. Creation of project, test suite, test case, keywords, variables, importing library, executing, tagging the test case is easily done in the editor. Robot framework also provides plugins for eclipse, sublime, Textmate, Pycharm that has support for robot test cases.

## Robot Framework Advantages

Robot framework is open source, so anyone who wants to try out can easily do so.

- It is very easy to install and helps in creating and executing test cases. Any new comer can easily understand and does not need any high level knowledge of testing to get started with robot framework.
- It supports keyword-driven, behaviour-driven and data-driven style of writing test cases.
- It is a good support for external libraries. Most used is Selenium Library, which is easy to install and use in robot framework.

## Robot Framework Limitations

Robot lacks support for if-else, nested loops, which are required when the code gets complex.

Robot Framework is an open source test automation framework for acceptance testing and acceptance-test-driven development. The test cases in Robot Framework are based on keywords written in tabular format, which makes it clear and readable, and conveys the right information about the intention of the test case. For example, to open browser, the keyword used is "Open Browser".

## **Conclusion**

Robot framework is built using python. In this chapter, we will learn how to set up Robot Framework. To work with Robot Framework, we need to install the following:

- Python
- pip
- Robot Framework
- wxPython for Ride IDE
- Robot Framework Ride

### Install Python

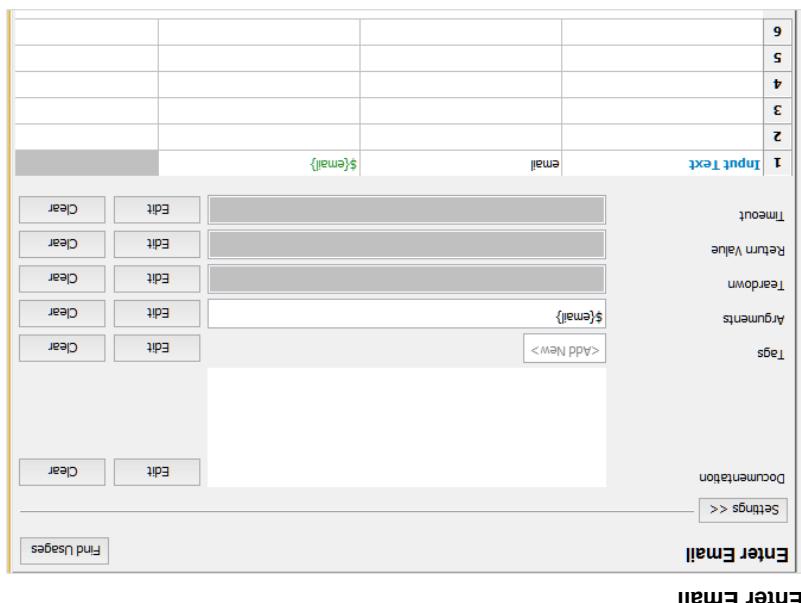

To install python, go to python official site: <https://www.python.org/downloads/> and download the latest version or the prior version of python as per your operating system (Windows, Linux/Unix, Mac, and OS X) you are going to use.

Here is the screenshot of the python download site:

Here, we will download Python version 2.7 as it is compatible to the Windows 8 we are using right now. Once done downloaded, install Python on your system by double-clicking on setup file downloaded. Follow the installation steps to install Python on your system. Once installed, to make Python available globally, we need to add the path to environment variables in windows as follows:

If we get the version of Python as output then, we have Python installed in our system. Otherwise, you will get a display as shown above.

**Enter Email**

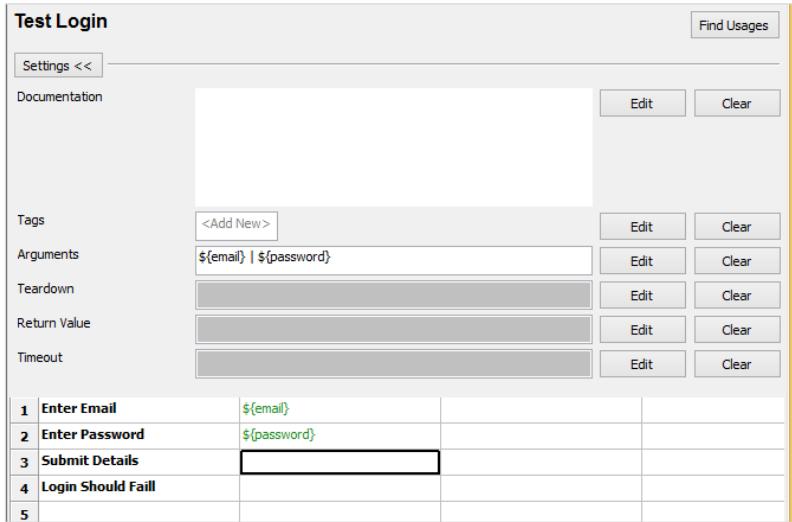

Before you download Python, it is recommended you check your system if Python is already present by running the following command in the command line:

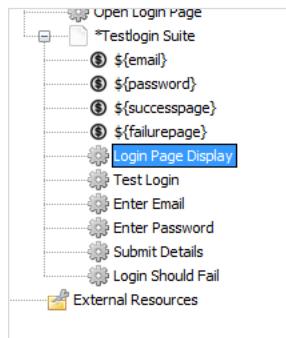

The latest version available as per release dates are as follows:

Robot

The following screenshot shows the keywords entered for Test Login:

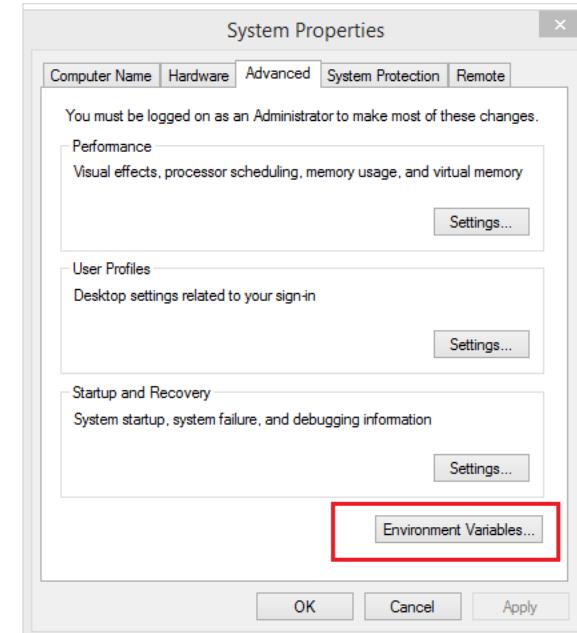

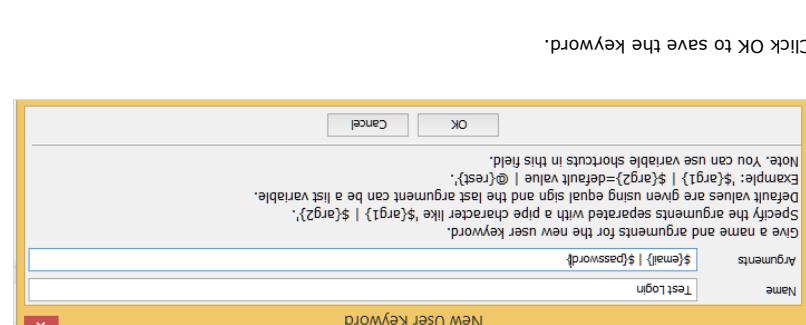

**Enter Email, Enter Password, Submit Details** and **Login Should Fail** are User Defined Keywords, which are defined as follows:

## Setting path for Windows

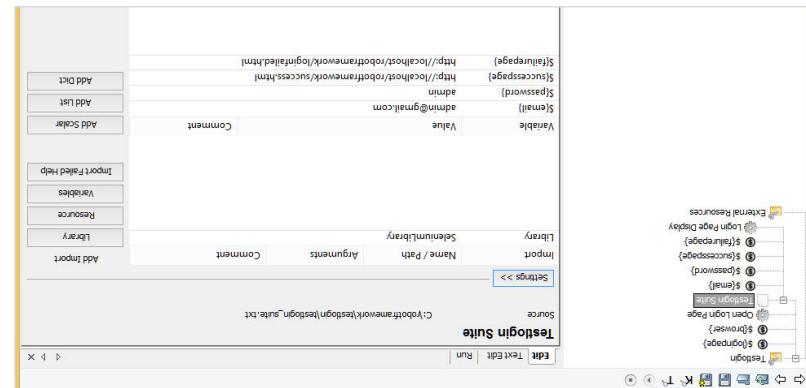

Right-click on My Computer icon and select properties. Click on Advanced System setting and the following screen will be displayed.

We have created email, password, successpage and failurepage scalar variables as shown in the above screenshot.

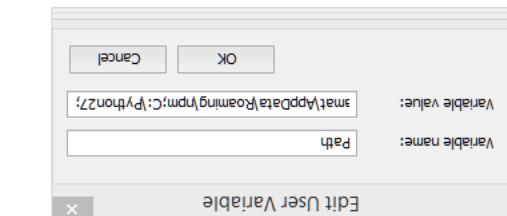

Now, we will create **Test Login** user defined keyword. Right-click on the test suite and

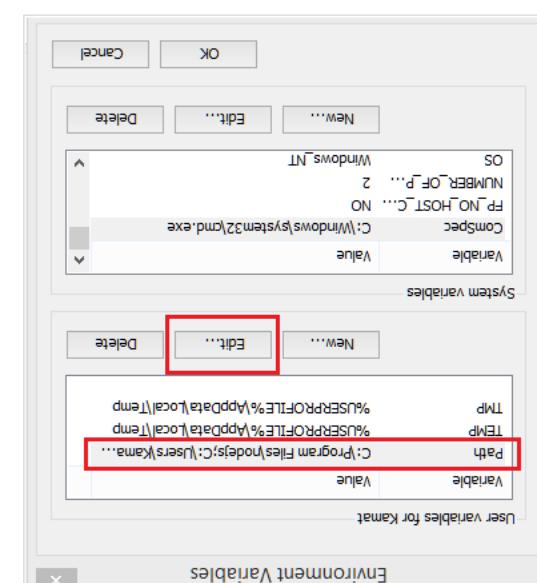

We will create scalar variables for test suite as follows:

Robot

Click on Environment Variables button highlighted above and it will show you the screen as follows:

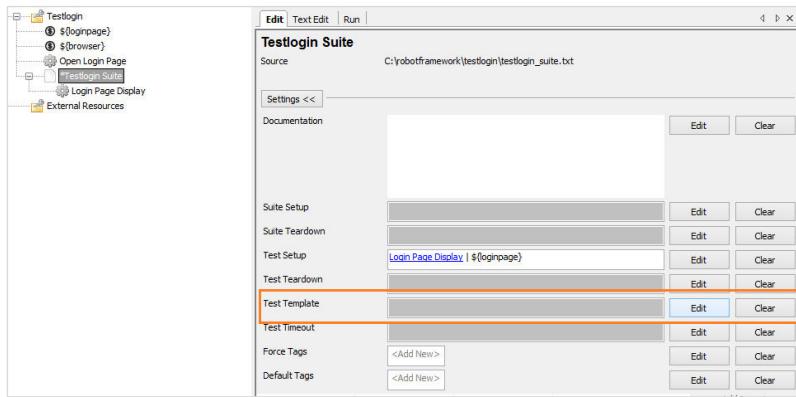

Select the Variable Path and click the Edit button.

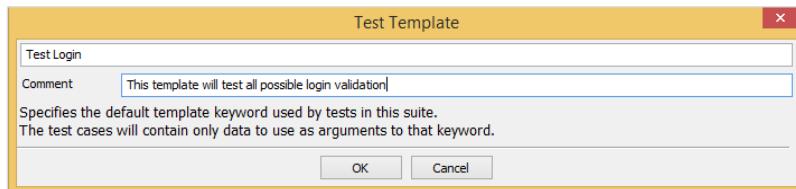

Get the path where python is installed and add the same to Variable value at the end as shown above.

Robot

To create template, click on the suite and on right side click Edit for Test Template.

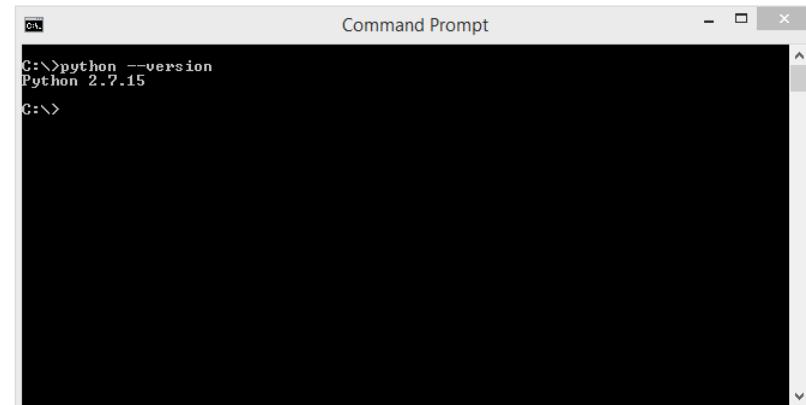

You will be directed to the following screen:

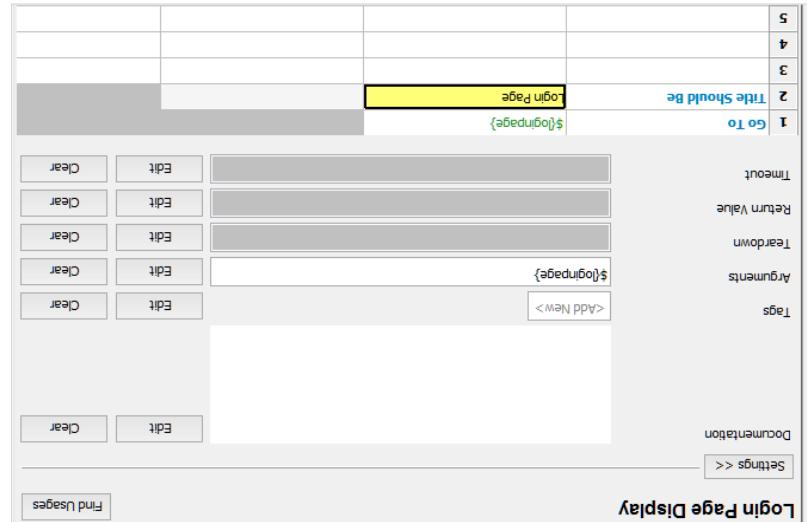

Test Login is again a user-defined keyword. Click OK to save the template.

Before we create the Test Login keyword, we need some scalar variables. The scalar variables will have the details of the email-id, password, successpage, failurepage, etc.

Once this is done, you can check if python is installed from any path or directory as shown below:

Robot

Let us now see a few simple steps to install Python on Unix/Linux machine. Open a Web browser and go to <https://www.python.org/downloads/>. Follow the link to download zipped source code available for Unix/Linux.

- Download and extract files.
- Editing the Modules/Setup file if you want to customize some options.
- run ./configure script
- make
- make install

This installs Python at standard location /usr/local/bin and its libraries at /usr/lib/pythonXX where XX is the version of Python.

To add the Python directory to the path for a particular session in Unix –

### Setting Path at Unix/Linux

In the csh shell

type setenv PATH "/usr/local/bin/python" and press Enter.

In the bash shell (Linux)

type export PATH=\$PATH:/usr/local/bin/python and press Enter.

Now, we will check for the next step, which is pip installation for python. Pip is a package manager to install modules for Python.

Note – /usr/local/bin/python is the path of the Python directory type PATH="\$PATH:/usr/local/bin/python" and press Enter.

Here we want to go to the **LoginPage** and check if the title of the page matches with the value given.

Now, we will add template to the test suite and create data driven test cases.

In the command

Now, we will check for the next step, which is pip installation for python. Pip is a package manager to install modules for Python.

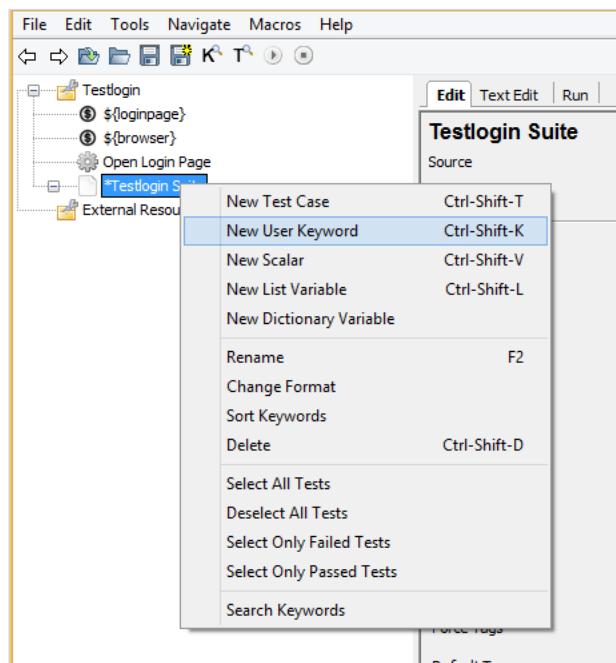

Pip gets installed along with python and you can check the same in command line as follows:

Now, we will check for the next step, which is pip installation for python. Pip is a package manager to install modules for Python.

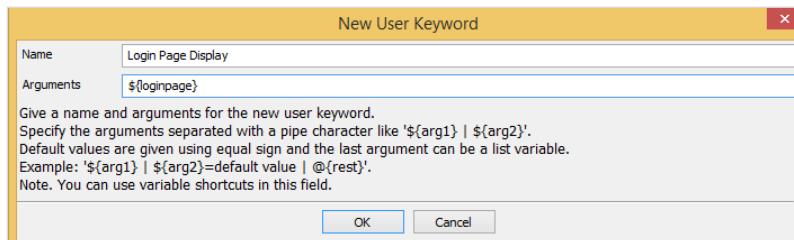

Pip --version

## 3. Robot – UNIX and Linux Installation

Right-click on the test suite and click **New User Keyword** as shown below:

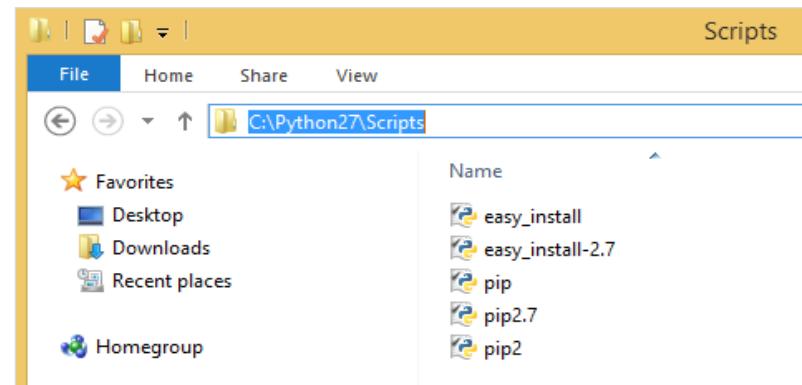

New User Keyword will display the screen as shown below:

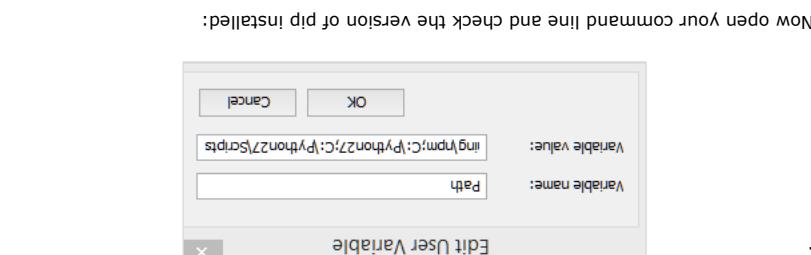

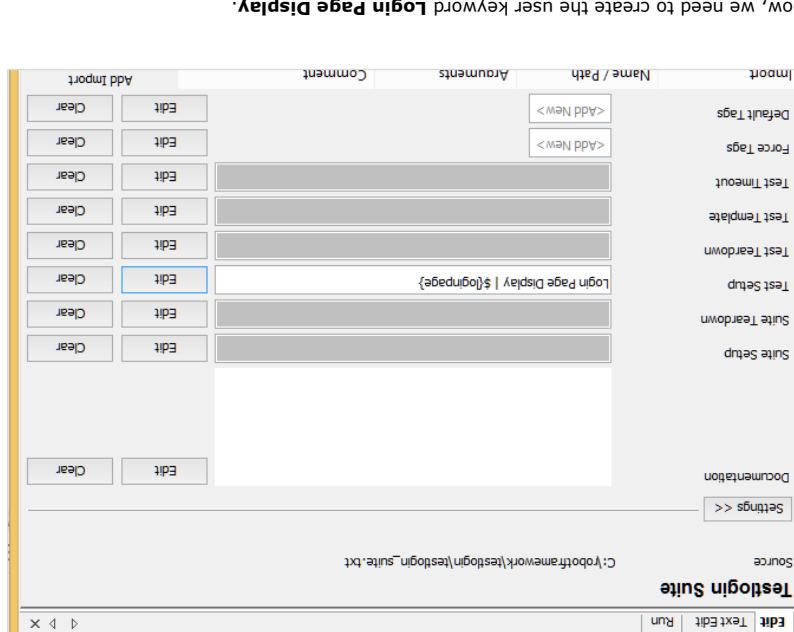

Click OK to save the keyword.

```
C:\>pip --version
'pip' is not recognized as an internal or external command,
operable program or batch file.
C:\>_
```

Here we are still not getting the version for pip. We need to add the pip path to Environment variables so that we can use it globally. PIP will be installed in Scripts folder of python as shown below:

C:\Python27\Scripts to environment variables as follows:  
Go back to environment variables and add the path of pip to the variables list. Add

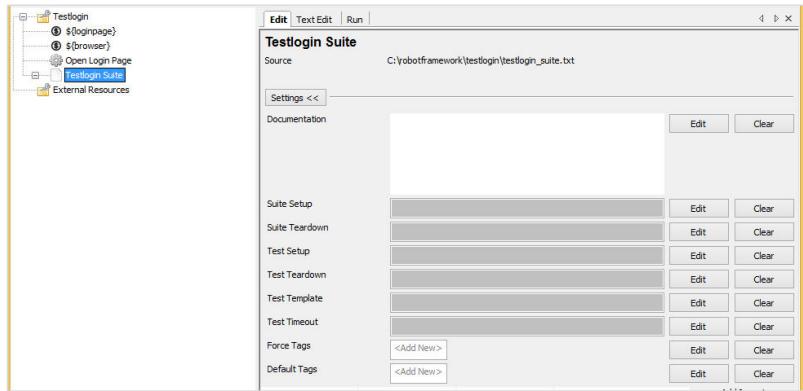

We will now use pip - python package manager to install the robot framework and the command for it is as follows:

## Install Robot Framework

So now, we have python and pip installed.

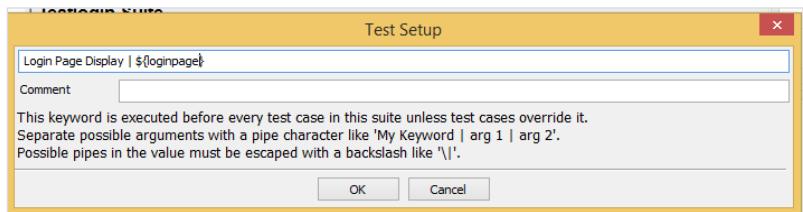

## Robot

Now, click the Testlogin Suite we have created.

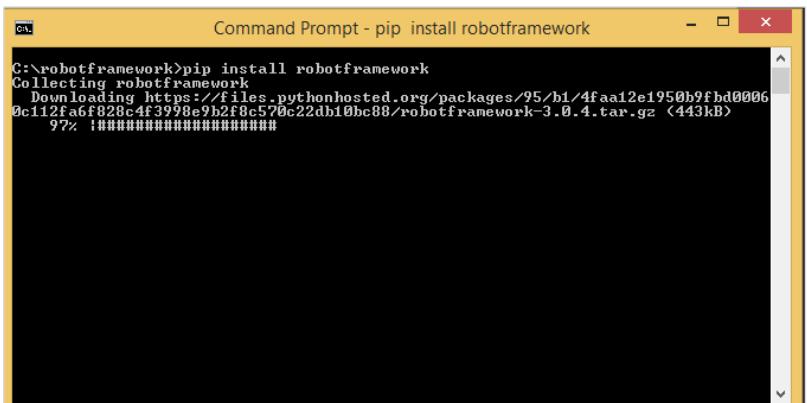

Let us now create a setup for the test suite – Test Setup. This setup needs to get executed first.

Click Edit for Test Setup and enter the details.

For the Test Setup, we have created User defined Keyword called **Login Page Display**, which will take the argument as **`\${loginpage}`** as in the above screenshot.

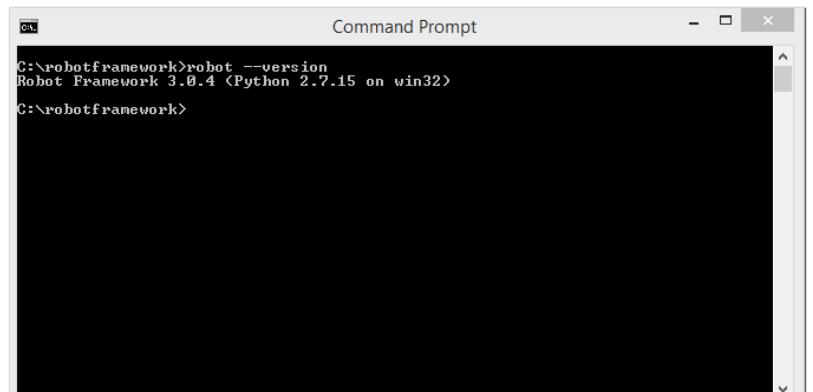

Click OK to save the test setup.

Once the installation is done, you can check the version of robot framework installed as shown below:

### Command

```
robot --version
```

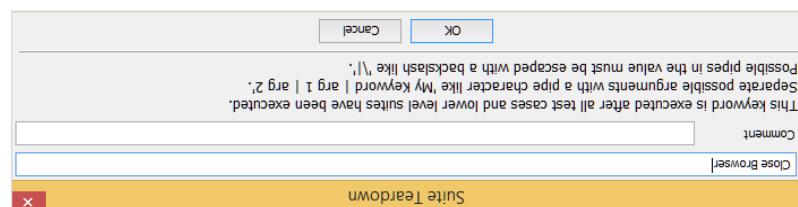

So, we can see Robot Framework 3.0.4 is installed.

### Install wxPython

We need wxPython for Robot Framework Ride, which is an IDE for Robot Framework.

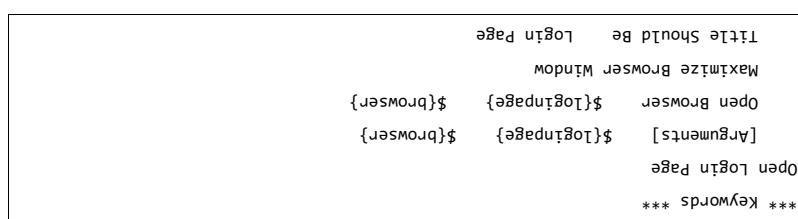

For Suite teardown, we are directly using library keyword, which will close the browser.

Click Edit for Suite Teardown and enter the details:

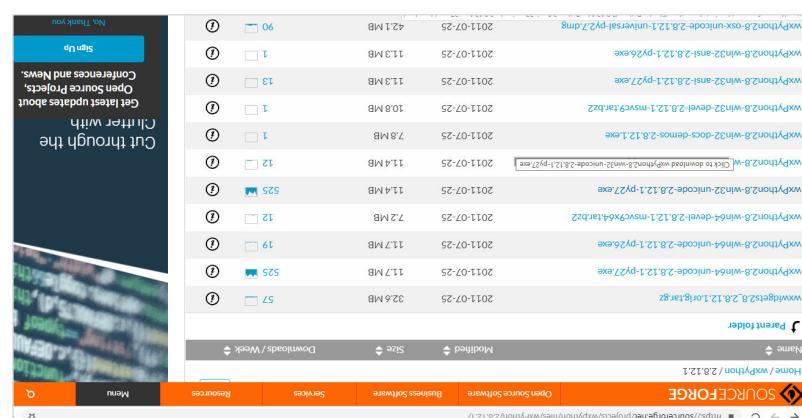

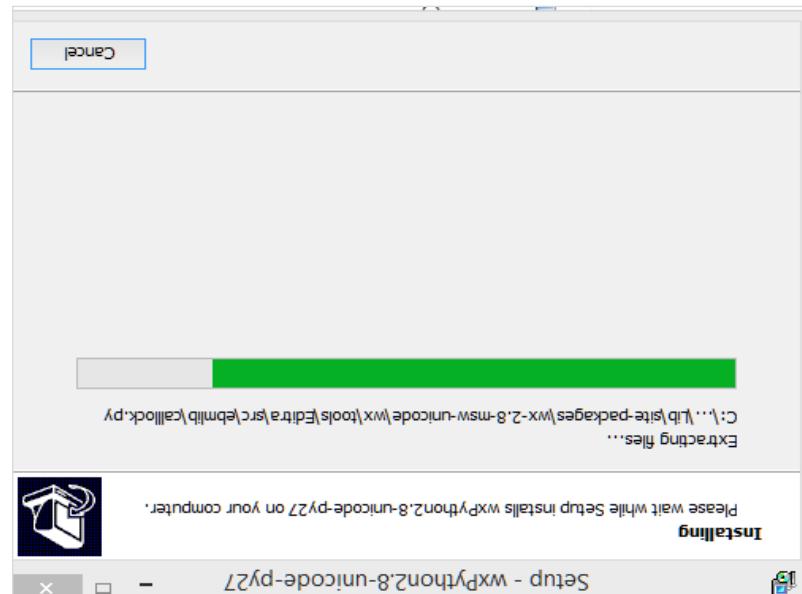

Now, we will create **Suite Teardown** for the suite.

Open **Login Page** user-defined keyword has the following details:

Robot

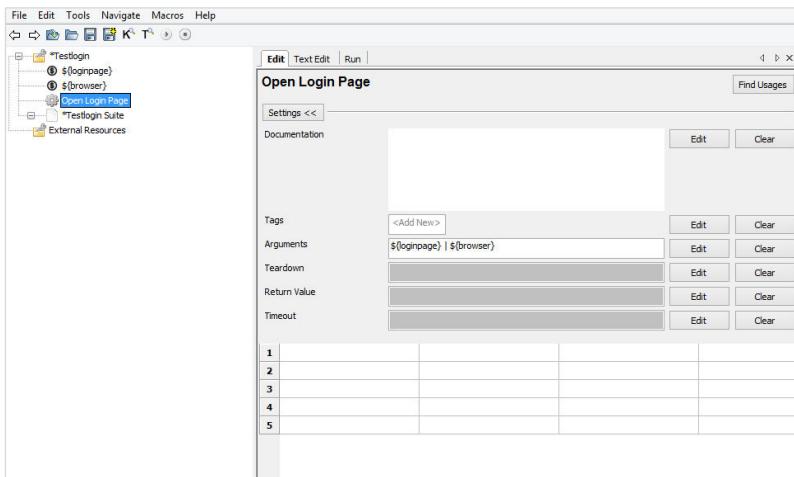

And, download 32 or 64-bit wxPython for windows as per your Windows Operating system.

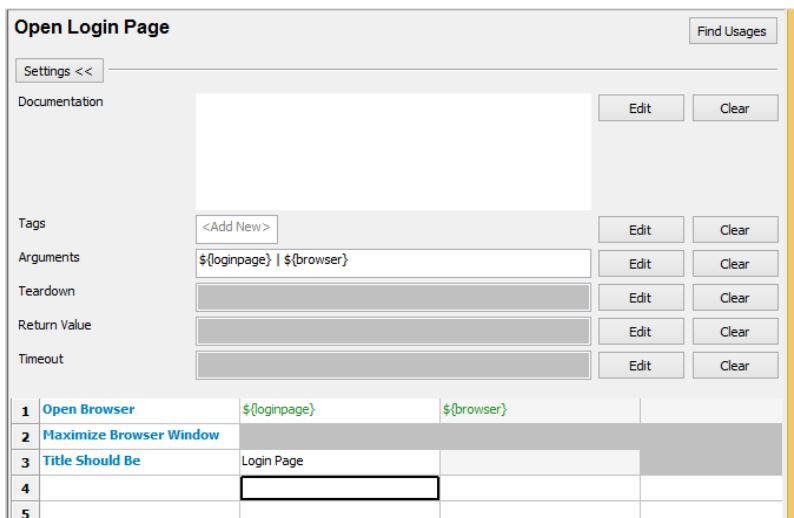

<http://sourceforge.net/projects/wxPython/files/wxPython/2.8.12.1/>

For windows to get the required download for wxPython, go to the following URL:

Robot

Now we need to enter the library keywords, which will open the URL.

Once the installation is done, it opens the command line and auto runs some commands as shown below:

```
C:\Python27\python.exe
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\art\_default.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\art\_internal.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\art\_msu.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\bar\_py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\buttonbar.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\control.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\gallery.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\page.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\panel.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\ribbon\togglebar.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\rulerctrl.py ...
Compiling C:\Python27\Lib\site-packages\wx-2.8-msw-unicode\wx\lib\agw\shapedbutton.py ...
```

wxPython is now installed. This module is required for the RIDE Ide to be used for Robot Framework which is the next step.

**On Linux**, you should be able to install wxPython with your package manager. For example, on Debian based systems such as Ubuntu running sudo apt-get install python-wxgtk2.8 ought to be enough.

**On OS X**, you should use wxPython binaries found from the wxPython download page. wxPython2.8 only has 32 bit build available, so Python must be run in 32-bit mode also. This can be done globally by running:

```
> defaults write com.apple.versioner.python Prefer-32-Bit -bool yes
```

or, just for the RIDE execution:

```
> VERSIONER_PYTHON_PREFER_32_BIT=yes ride.py
```

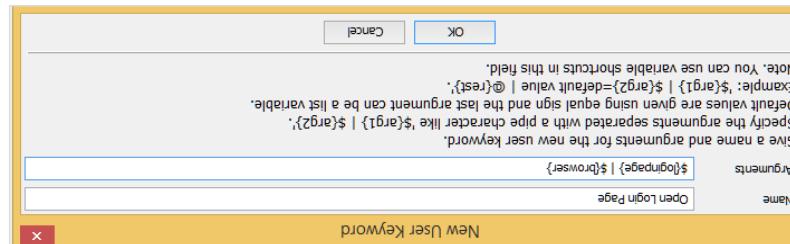

## Install Ride

Ride is Robot Framework IDE. We can use pip to install it as shown below.

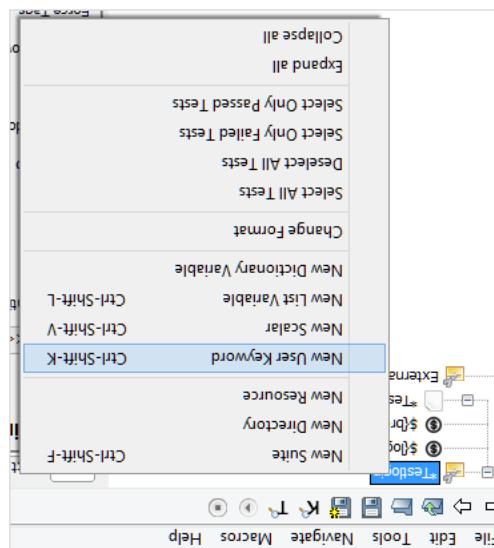

### Command

```
pip install robotframework-ride
```

Here the Keyword is given 2 arguments - \${logimpage} and \${browser}. Click OK to save the user keyword.

Upon clicking **New User Keyword**, the following screen appears:

Right-click on the project and click **New User Keyword**:

Now, we have to create the user-defined keyword **Open Login Page**, which is done as follows:

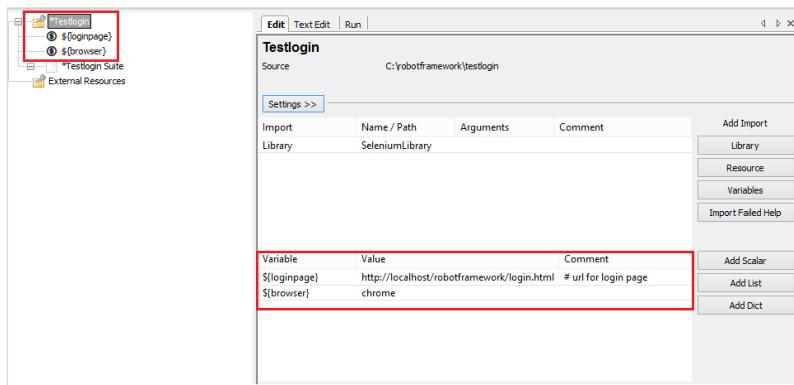

Click OK to save the setup.

We have created setup that is using user keyword **Open Login Page** with arguments \${logimpage} and \${browser}.

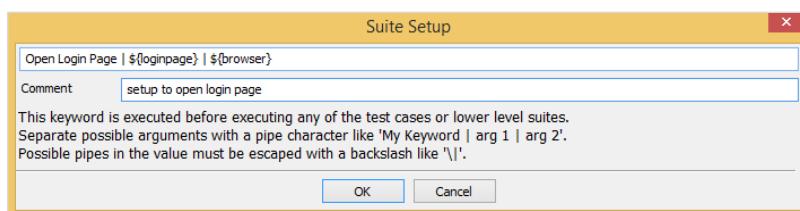

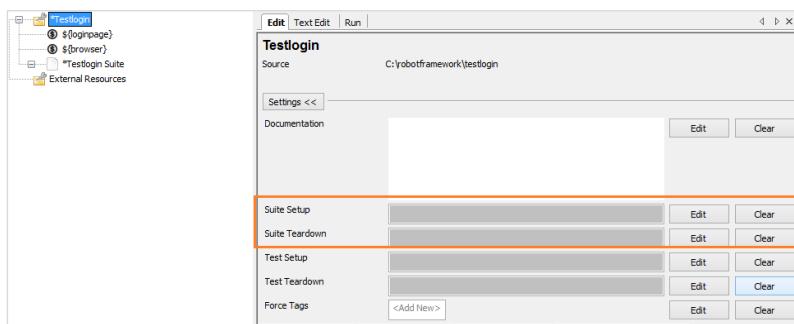

## Robot

The variables will be displayed under your project as follows:

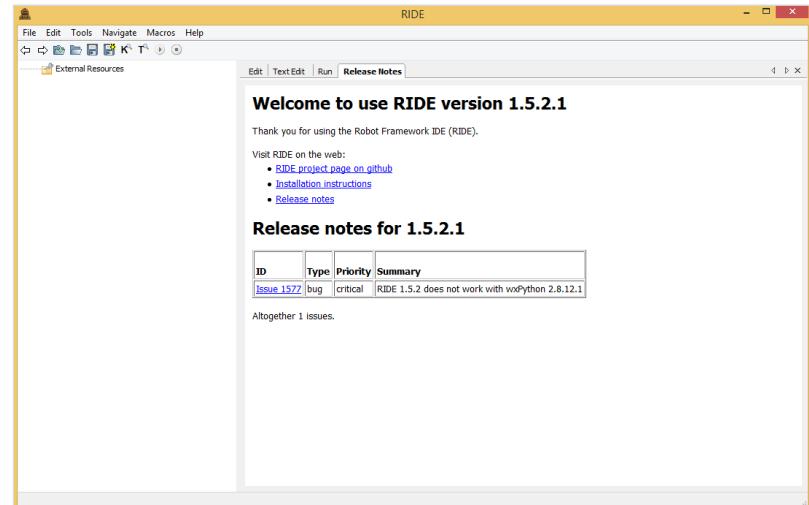

Now, we will add the setup and teardown for the main project.

Click on the project on the left side. In settings, click Suite Setup.

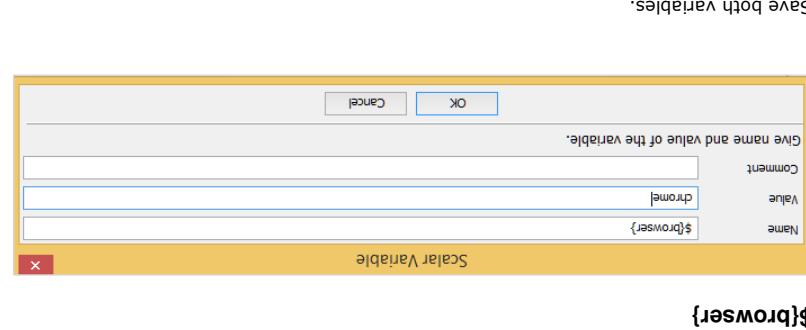

The above command opens the IDE as follows:

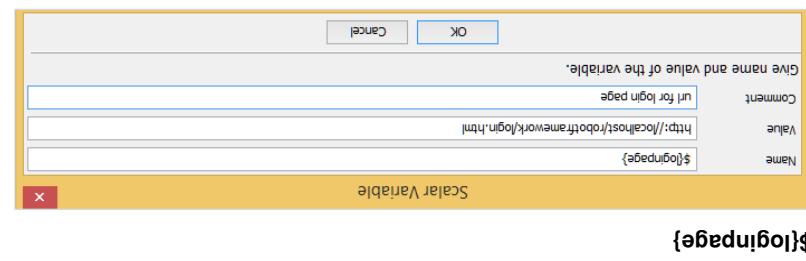

So we are done with the installation of Robot Framework and can get started working with it.

## Conclusion

We now know how to install python, pip, robot framework and also get RIDE installed to work with test cases in robot framework.

**`\${browser}`**

**`\${loginpage}`**

In ride, create 2 variables **`\${loginpage}`** and **`\${browser}`** as follows:  
 Now, we need 2 scalar variables that will help us store the values – url and the browser name.  
 For setup, we will create a user-defined keyword called **Open LoginPage**. This keyword will take 2 arguments, login page URL and browser name.  
 Now in the main Project, we will create a setup and teardown. We would like to open the login page in Chrome browser and maximize the window. In teardown, we will close the browser.

## Robot

Once the library is saved for the project, it will display the library in the settings:

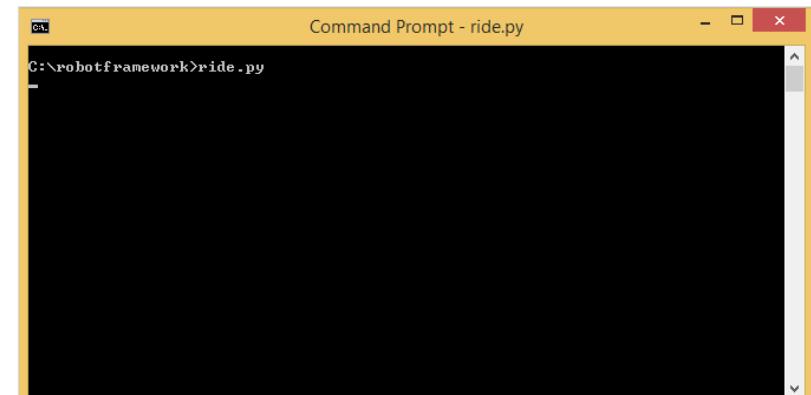

The screenshot shows the 'Testlogin' library settings in the Robot Framework interface. It includes a table for imports and variables, and a context menu for adding imports like Library, Resource, Variables, and Add Dict.

## 4. Robot Framework — Introduction to Ride

Ride is a testing editor for Robot Framework. Further, we will write test cases in Ride. To start Ride, we need to run the command shown below.

### Command

```
ride.py
```

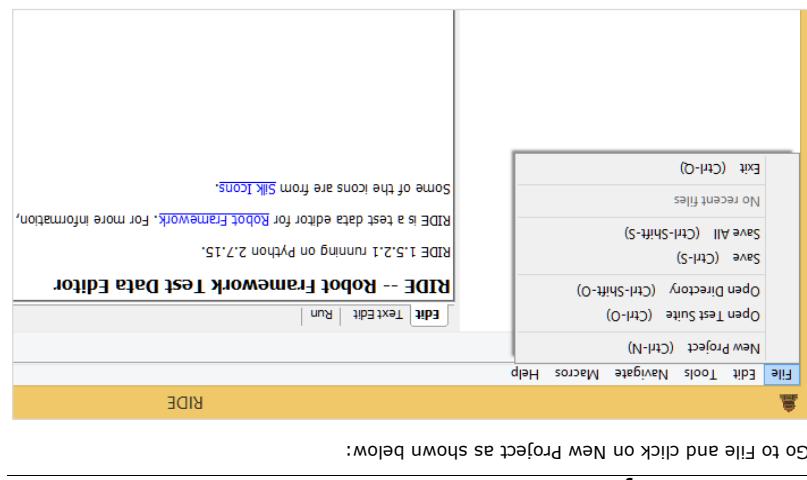

Repeat the same step for the Test suite created.

Here is the library added for Test suite:

The screenshot shows the 'Testlogin Suite' test suite settings in the Robot Framework interface. It includes a table for imports and variables, and a context menu for adding imports like Library, Resource, Variables, and Add Dict.

## Robot

The above command will open the IDE as shown in the following screenshot:

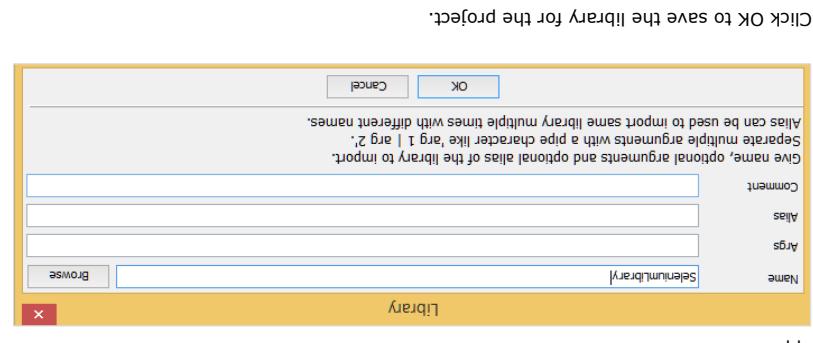

In this chapter, we will walk through the editor to see what options and features are available in the IDE. The options and features will help us in testing our project.

The above command will open the IDE as shown in the following screenshot:

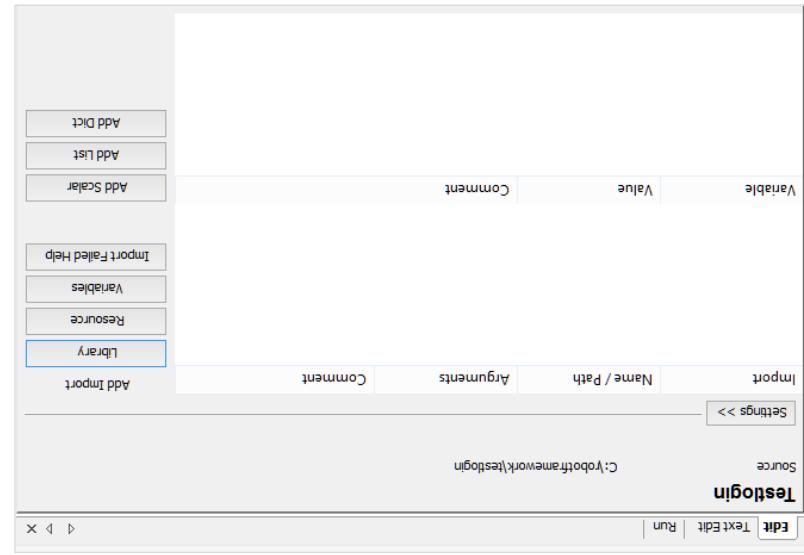

## Robot

The above command will open the IDE as shown in the following screenshot:

Click Library as in the above screenshot. Upon clicking Library, the following screen will appear.

Click Library as in the above screenshot. Upon clicking Library, the following screen will appear.

Import Library in the main project and also to the test suite created.

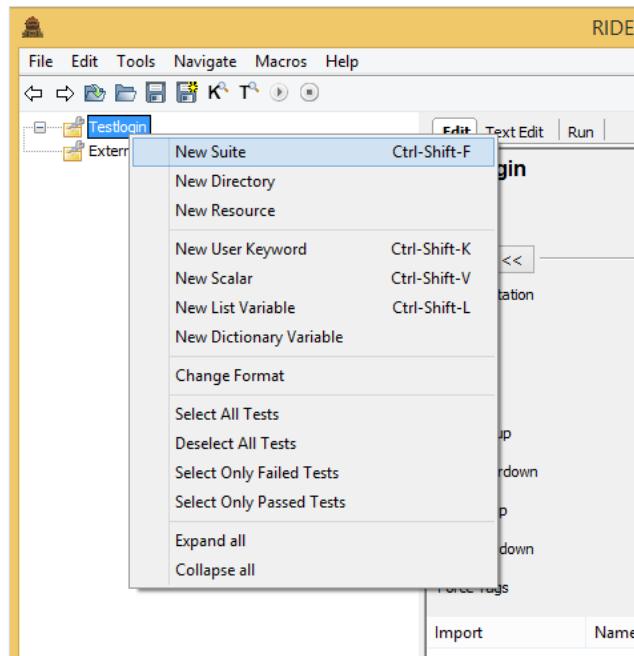

## Robot

Import Library in the main project and also to the test suite created.

## Robot

Import Library in the main project and also to the test suite created.

Now, we will create test suite inside the project.

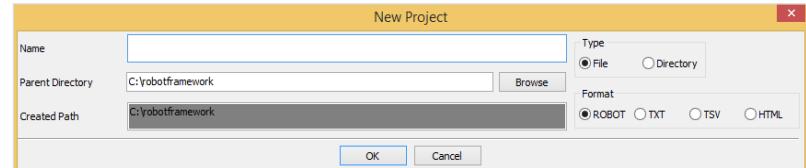

Click New Suite and it will display a screen as shown below:

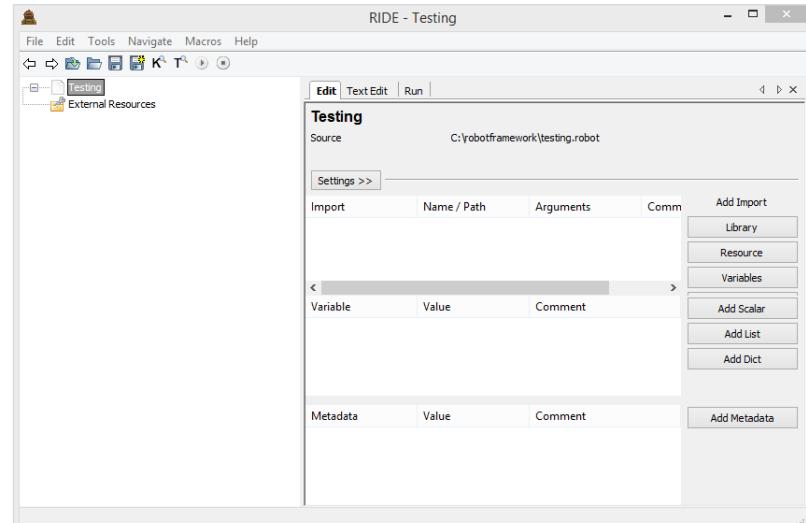

Click OK to save the test suite. We need to import the Selenium Library since we will be working with the browser.

The following screen will appear when you click New Project.

Enter the name of the project. Created Path is the path where the project will get saved. You can change the location if required. The project can be saved as File or directory. You can also save the project in format like ROBOT, TXT, TSV or HTML. In this tutorial, we are going to use the format ROBOT and how to write and execute test-cases.

Now, we will add a project as a file the way it is shown below. The project is named Testing and the following screen appears after the project is created.

The name of the project is shown on the left side and on the right side we can see three tabs Edit, TextEdit and Run.

Edit has a lot of options on the UI as shown above. In this section, we can add data required to run our test cases. We can import Library, Resource, Variables, Add scalar, Add list, Add dict and Add Metadata.

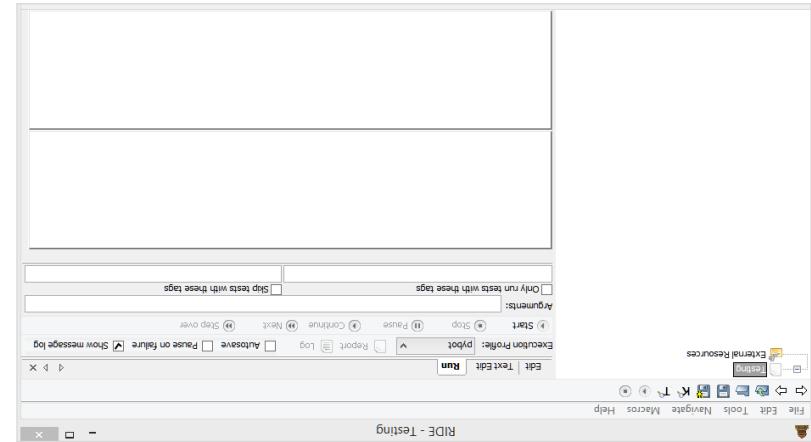

The details added in the Edit section will be seen in the next tab, Text Edit. You can write the code here in text edit section.

Click OK to save the project.

We will save the type of the project as Directory. The name given to the project is testlogin.

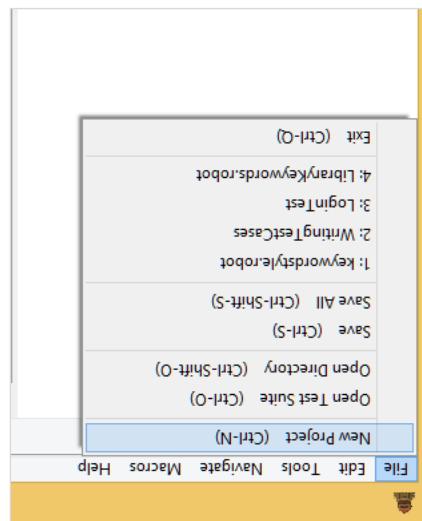

Click New Project and enter the name of the project.

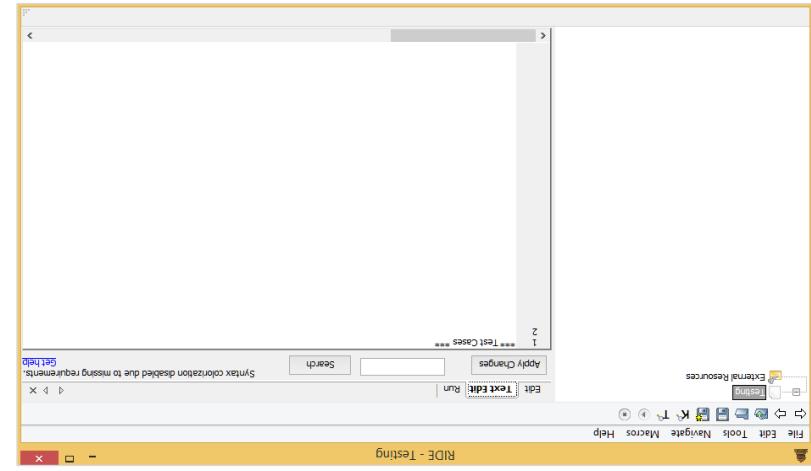

Once the test cases are ready, we can use the third tab Run to execute them.

If there is any change added in Texedit, it will be seen in the Edit section. Therefore, both Textedit and Texedit are dependent on each other and the changes done will be seen in both.

Once done, we will get started with the project setup as shown below:

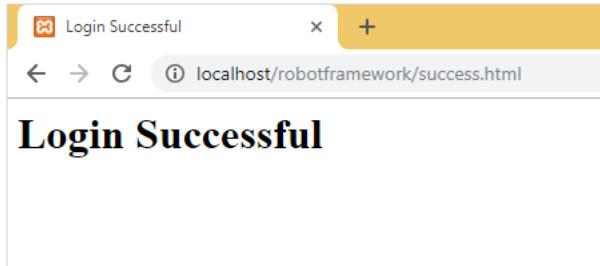

Robot

Robot

```
</body>  
</html>
```

The following screen appears when both the email id and password are valid:

#### HTML Code

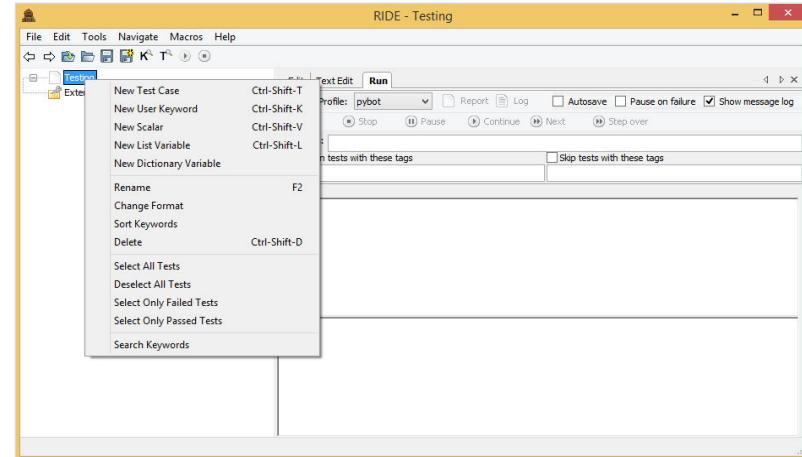

```
<html>  
<head>  
<title>Login Successful</title>  
</head>  
<body>  
<div id="loginfail">  
<h1>Login Successful</h1>  
</div>  
</body>  
</html>
```

Robot

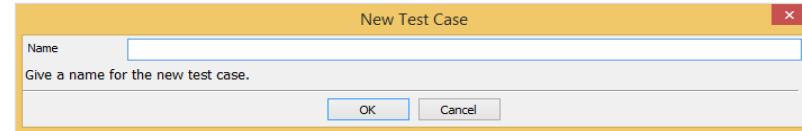

The Run UI is as shown above. It allows to run the test case and comes with options like start, stop, pause continue, next test case, step over, etc. You can also create Report, Log for the test cases you are executing.

To create a test case, we have to do the following:

Right-click on the project created and click on new test case as shown below:

Upon clicking New Test Case, a screen appears as shown below:

Now we are going to write test cases for the above test page. To start with it, we will first run the command to open Ride.

#### Command

```
ride.py
```

193

22

```

</html>
</div>
</body>
</head>
</html>
<title>Login Failed</title>
<head>
</head>
<body>
<div id="LoginFailed">
<h1>Login Failed</h1>
</div>
</body>
</html>

```

**HTML Code**

The following screen appears when either the email-id or the password is not valid:

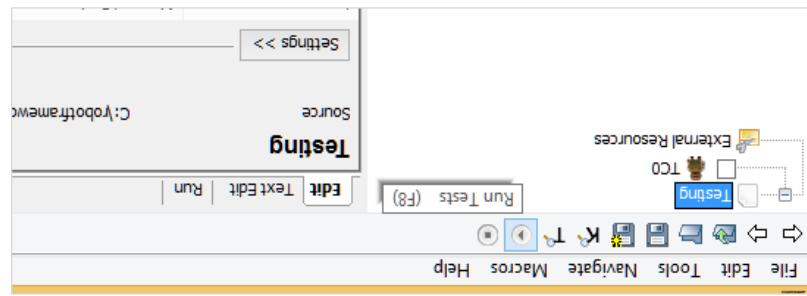

```

</html>
</body>
</div>
</div>
</form>
</script>
}

location.href = "http://localhost/robotframework/LoginFailed.html";
else {
location.href = "http://localhost/robotframework/success.html";
}

document.getElementById("password").value == "admin" ) {
if (document.getElementById("email").value == "admin@gmail.com" &&

```

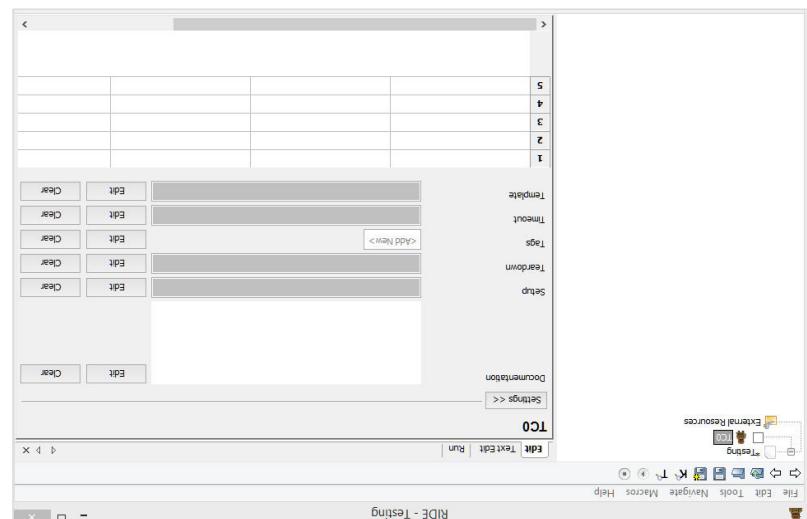

There are shortcuts available in the navigation bar to run/stop test case as shown below:

The test cases can be written in tabular format as shown below. Robot framework test cases are keyword based and we can write the test-cases using built-in keywords or keywords imported from the library. We can also create user-defined keywords, variables, etc. in robot framework.

of these details in our subsequent chapters.

Template. They have an edit button for each option. Upon clicking the button a screen appears wherein, you can enter the details for each option. We will discuss the various parameters of the test case has options like Documentation, setup, teardown, tags, timeout and wherein, you can enter the details for each option. We will discuss the various parameters of the test cases available in the navigation bar to run/stop test case as shown below:

Enter the name of the test case and click OK. We have saved the test case as TC0. The following screen appears once the test case is saved.

## 19. Robot Framework — Testing Login Page Using Robot Framework

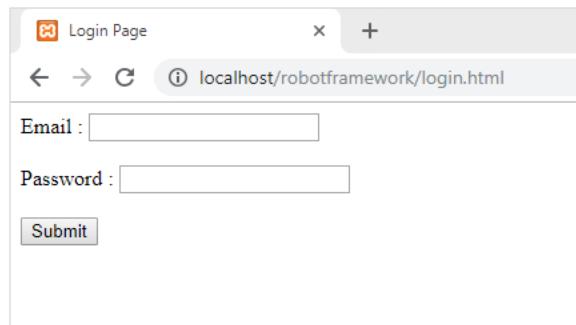

Robot

With Robot Framework, we have learnt the following so far:

- Import Libraries
- Working with variables
- Create custom Keywords
- How to write test-cases
- How to create Setup and teardown
- How to execute test cases
- How to work with data driven test-cases

We will use all of the above features and use it to test login page in this chapter. We have a login page which takes in email-id and password. When you enter correct email id and password, you will be redirected to a welcome page. If the user enters invalid email id or password, the page will get redirected to error page.

The following screenshot shows a login page:

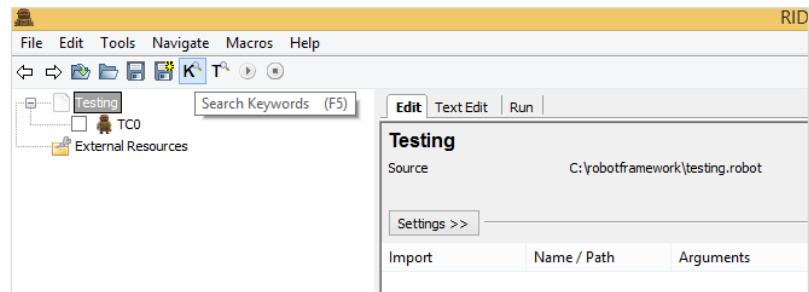

### HTML Code

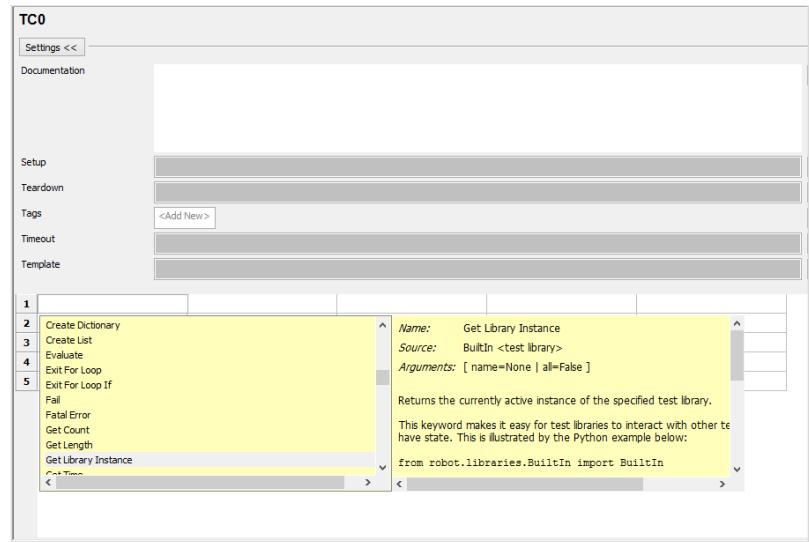

```
<html>
<head>
<title>Login Page</title>
</head>
<body>
<script type="text/javascript">
function wsSubmit() {
```

191

The search keyword option can be used as shown in the screenshot below:

To get the list of keywords available with robot framework, simple press ctrl+space in the tabular format as shown below and it will display all the keywords available:

In case, you cannot remember the keyword, this will help you get the details. We have the details available across each keyword. The details also show how to use the related keyword. In our next chapter, we will learn how to create our first test case in ride.

### Conclusion

In this chapter, we have seen the features available with RIDE. We also learnt how to create test cases and execute them.

24

## Robot

We will execute the test case and see the output:

```

Execution Profile: pybot
Arguments:
    Only run tests with these tags: None
    Skip tests with these tags: None

Elapsed time: 0:00:02 pass: 1 fail: 0
command: pybot --argumentfile c:\users\kanat\appdata\local\temp\RIDEtfvyrf d\argfile.txt --listener C:\Python27\lib\site
=====
DatabaseTesting
=====
TC1
=====
| PASS |
DatabaseTesting
1 critical test, 1 passed, 0 failed
1 test total, 1 passed, 0 failed
=====
Output: c:\users\appdata\local\temp\RIDEtfvyrf d\output.xml
Log: c:\users\appdata\local\temp\RIDEtfvyrf d\log.html
Report: c:\users\appdata\local\temp\RIDEtfvyrf d\report.html
test finished 20181020 11:09:38

```

The results from the table are shown for the queryResults.

### Log Details

**DatabaseTesting Test Log**

**Test Execution Log**

- SUITE** DatabaseTesting
  - Full Name: DatabaseTesting
  - Source: C:\robotframework\databaseTesting.robot
  - Start / End / Elapsed: 20181020 11:09:37.617 / 20181020 11:09:38.073 / 00:00:00.456
  - Status: 1 critical test, 1 passed, 0 failed  
1 test total, 1 passed, 0 failed
- TEST** TC1

Right-click on ride.py and click **Send To -> Desktop** (create shortcut).

You will now see an icon of ride on your desktop. You can click on it to open the ride editor.

We have connected to the database, checked if table customer exists in database, got the query executed and logged the details of the query.

Here are the details:

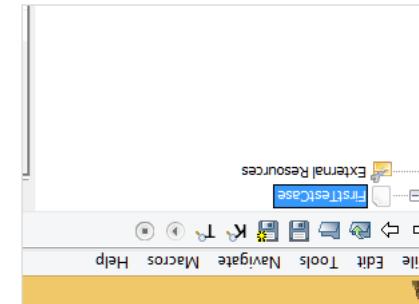

1	Connect To Database	pymysql	\$dbname	
2	Table Must Exist	customer		
3	Check If Exists In Database	SELECT * FROM customer		
4	Query	SELECT * FROM customer		
5	Log	if (queryResults[0]) { echo "Query results: " . print_r(\$queryResults[0], true); }		
6				
7				
8				

We will add some more test cases as shown below:

Robot

To create test case, right-click on the project.

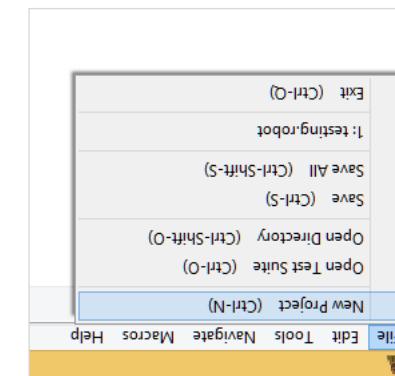

Project FirstTestCase is created.

Parent Directories is the path where the project will be saved. You can change the path if needed. I have created a folder called robotframework and will save all the files in that

Click on *New Project* and enter the name of the project.

Let us start with our first test case in ride. Open the editor and click on File -> New Project.

Robot

## Robot

We will use phmyadmin to show the customer database:

We have a table called `customer`, which has data distributed in 6 rows. Now will write test-case which will connect to MySQL database `customers` and fetch the data from `customer` table.

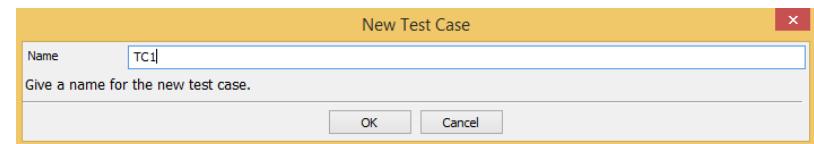

Before we start, we will create scalar variables which will hold the data for `dbname`, `dbuser`, `dbpasswd`, `dbhost`, `dbport` and `queryresult` to store data, etc. Here are the variables created with values:

Variable	Value	Comment
<code> \${dbname}</code>	<code>customers</code>	
<code> \${dbuser}</code>	<code>root</code>	
<code> \${dbpasswd}</code>	<code>admin</code>	
<code> \${dbhost}</code>	<code>localhost</code>	
<code> \${dbport}</code>	<code>3306</code>	
<code> @ {queryResults}</code>		

The command to connect to database is:

```
Connect To Database    pymysql    ${dbname}    ${dbuser}    ${dbpasswd}
${dbhost}    ${dbport}
```

Click `New Test Case`.

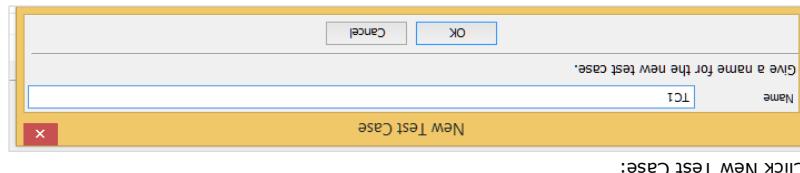

Enter the name of the test case and click OK.

1	Connect To Database	pymysql	\${dbname}	\${dbuser}	\${dbpasswd}	
2						
3						
4						
5						
6						

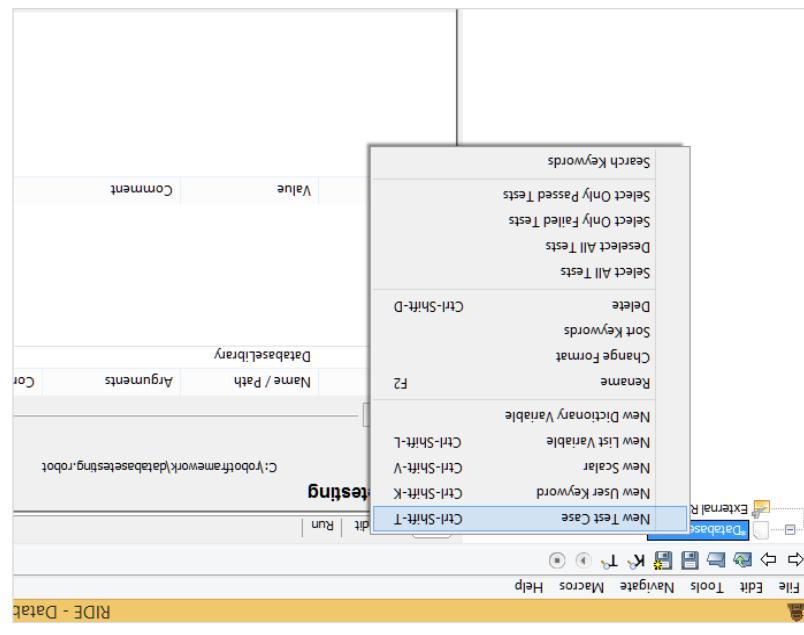

We are going to use the existing database called **customers** available with us.

Enter the name of the test case and click OK.

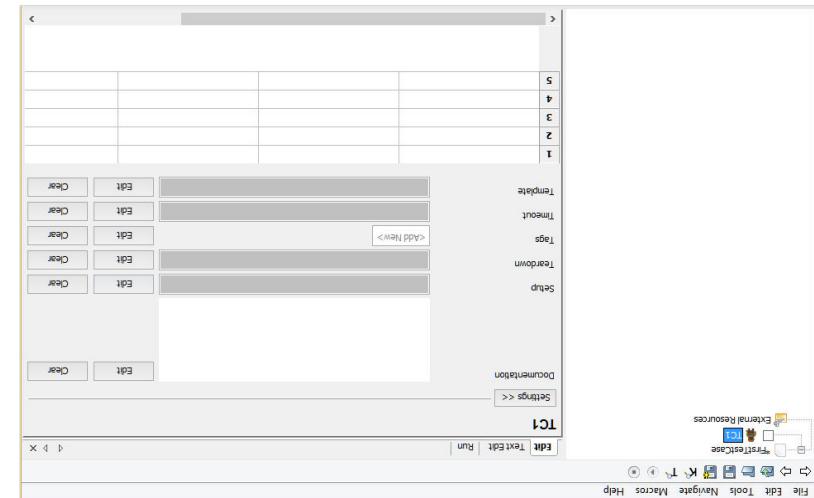

Click New Test Case:

Now create test case under the project created.

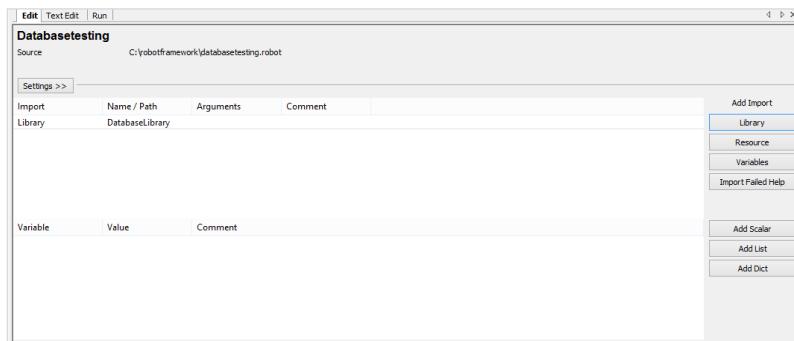

The Edit tab comes with two formats - Settings and Tabular. We will discuss the two formats in our subsequent sections.  
There are 3 tabs shown for the test case created - Edit, Text Edit and Run.

Robot

Robot

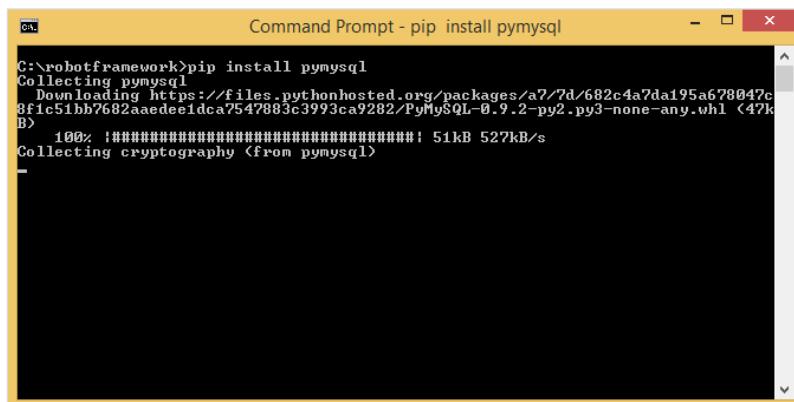

Once saved, the library is as shown below:

We are going to work with MySQL Database. To work with MySQL, we need to install the module.

## Command

```
pip install pymysql
```

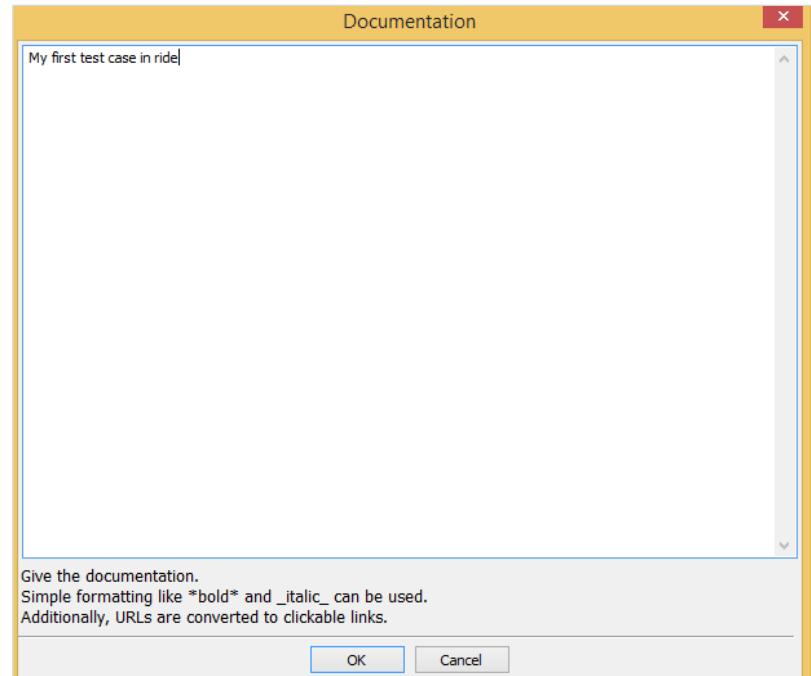

## The Settings Format

In Settings, we have documentation, setup, teardown, tags, timeout and template.

### Documentation

You can add details about your test case so that it becomes easy for future reference.

Click OK to save the documentation.

### Setup and Teardown

If there is a setup assigned to a test case, it will be executed before the test case execution and the test setup that will be executed after the test case is done for teardown. We will get into the details of this in our subsequent chapters. We do not need it now for our first test case and can keep it empty.

### Tags

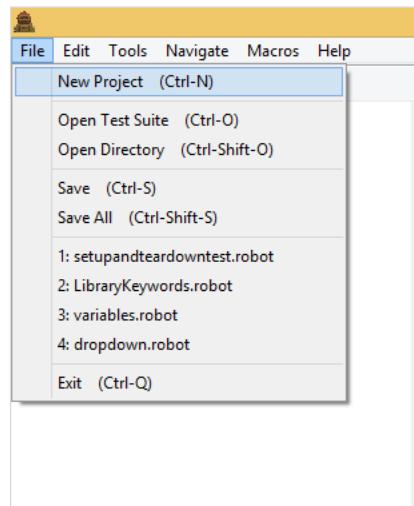

This is used for tagging test cases – to include, exclude specific test cases. You can also specify if any of the test cases is critical.

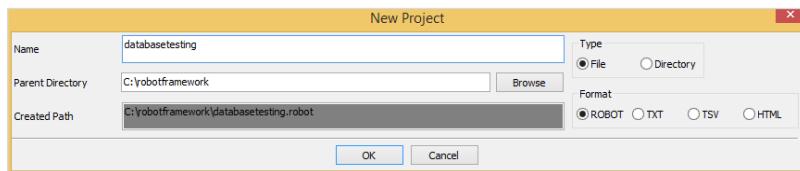

Robot

## Import Database Library

Open ride using **ride.py** from command line and create the project for testing database.

Click New Project and give a name to the project.

Click OK to save the project.

Based on the keywords specified in Edit, we can get the code in Text Edit as shown below:

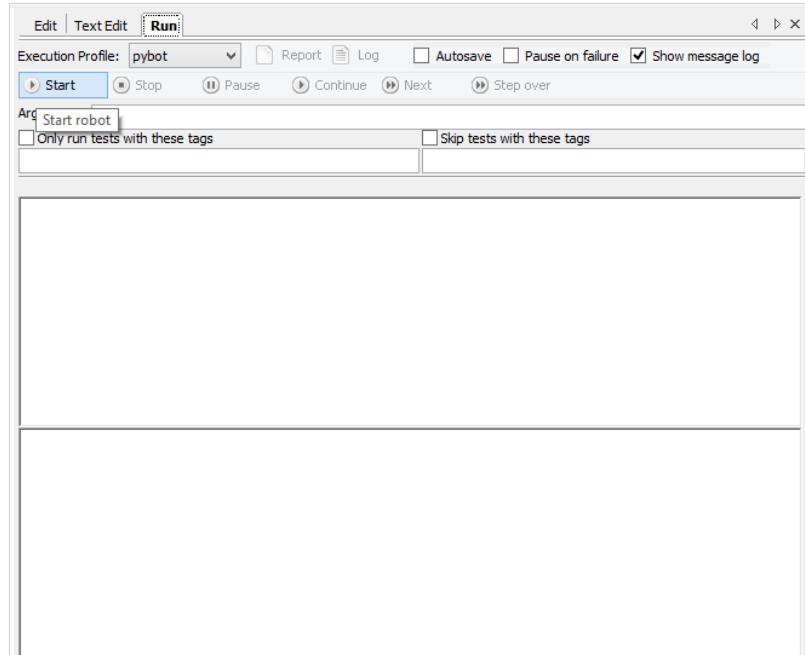

A screenshot of the 'Text Edit' tab in the IDE. The code area contains the following text:

```
1 *** Test Cases ***
2 TC1
3 [Documentation] My first test case in ride
4 Log Welcome to our first test case
5 Log In robot framework
6 Log End of the test case
7
```

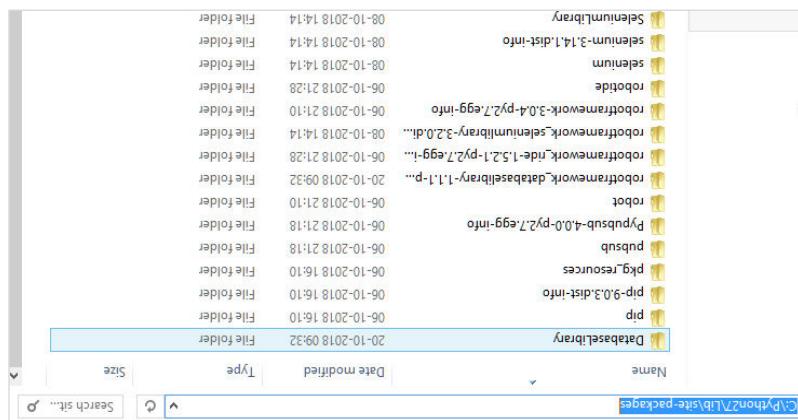

The status bar at the top right says 'Syntax colorization disabled due to missing requirements' and 'Get help'.

You may also write the test case in the Text Edit and the same will reflect in the tabular format. Now let us Run the test case and see the output.

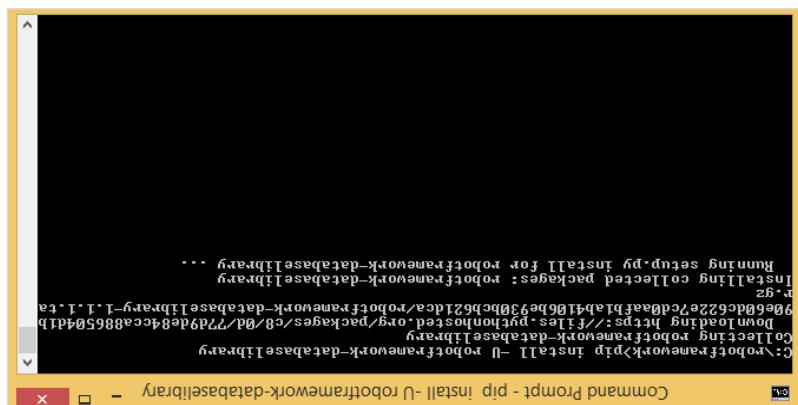

To run the test case, we need to click on Start as shown below:

Once the installation is done, the next step is to import the library inside the project and use it with test cases.

The library is stored in python lib folder as shown below:

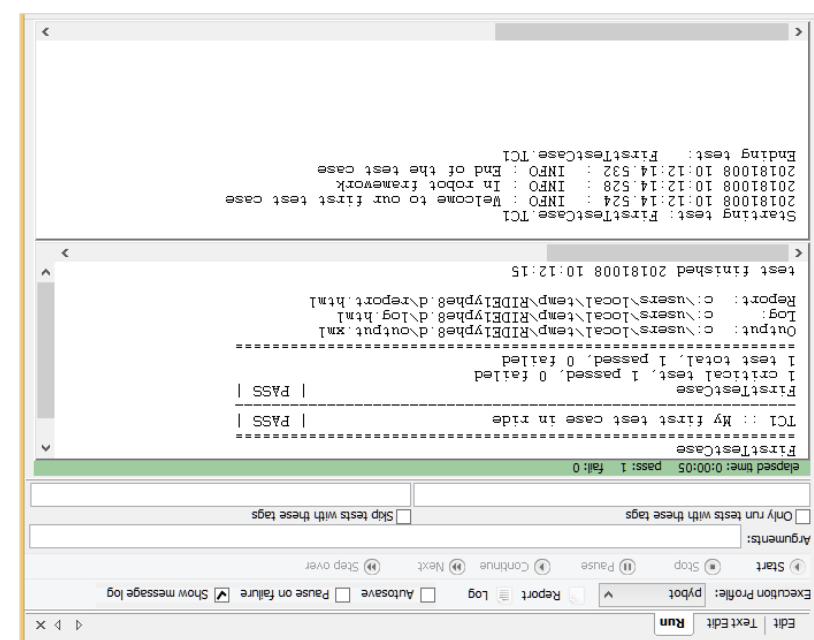

Run the above command in the command line as shown below:

Robot

Robot

Our test case has executed successfully and the details are as shown above. It gives the status as PASS. We can also see the details of the test case execution in Report and Log as highlighted below.

Click on start and here are is the output of the test case:

## Robot

Upon clicking the Database Library (Python), you will be redirected to the screen where the instruction for installation are listed as shown in the following screenshot:

The screenshot shows a web page with the URL [franz-see.github.io/Robotframework-Database-Library/](https://franz-see.github.io/Robotframework-Database-Library/). It contains sections for 'Install' and 'License'. The 'Install' section provides instructions for using easy\_install and pip, along with their respective command examples. The 'License' section links to the Apache License 2.0.

**Install**

Using easy\_install

```
easy_install robotframework-databaselibrary
```

Using pip

```
pip install -U robotframework-databaselibrary
```

From Source

Download source from <https://github.com/franz-see/Robotframework-Database-Library/archives/0.2>. Extract the tarball or the zip file then enter the extracted directory. Then run

```
python setup.py install
```

**License**

We can install the database library using pip and the command is:

```
pip install -U robotframework-databaselibrary
```

## Robot

Click on Report and it opens the details in a new tab as follows:

The screenshot shows a browser window displaying a test report titled 'FirstTestCase Test Report'. It includes a 'Summary Information' section with details like status, start time, end time, elapsed time, and log file path. Below that is a 'Test Statistics' section with tables for 'Total Statistics', 'Statistics by Tag', and 'Statistics by Suite'. At the bottom, there's a 'Test Details' section with tabs for 'Totals', 'Tags', 'Suites', and 'Search', and a 'Type' filter for 'Critical Tests' and 'All Tests'.

**FirstTestCase Test Report**

**Summary Information**

Status:	All tests passed
Start Time:	2018/08/08 10:12:14.324
End Time:	2018/08/08 10:12:14.542
Elapsed Time:	00:00:00.218
Log File:	log.html

**Test Statistics**

	Total	Pass	Fail	Elapsed	Pass / Fail
Critical Tests	1	1	0	00:00:00	██████████
All Tests	1	1	0	00:00:00	██████████

	Total	Pass	Fail	Elapsed	Pass / Fail
No Tags					

	Total	Pass	Fail	Elapsed	Pass / Fail
FirstTestCase	1	1	0	00:00:00	██████████

**Test Details**

Totals Tags Suites Search

Type: Critical Tests All Tests

In Report, it gives the details like the start time, end time, path to the log file, status of the test case, etc.

Click on Log at the top right corner in report or from the Run screen.

above.

We will now take a look at the external library in this chapter. Upon clicking External, the following screen appears:

The Log file gives the details of the test execution and the details of keywords we gave for

In the report and the log file, we get green color for the status.

Upon clicking Libraries, you will be redirected to a screen as shown below:

LIBRARIES

et us know if there are useful libraries missing from the list.  
your needs. Creating your own test libraries is a breeze.

separately developed external libraries that can be installed based  
on the framework, and a library of  
ibraries that are bundled in with the framework.  
amework by providing keywords. There are several standard  
ameworks provide the actual testing capabilities to Robot  
est libraries are missing from the list.

Here are the details of the log file:

100

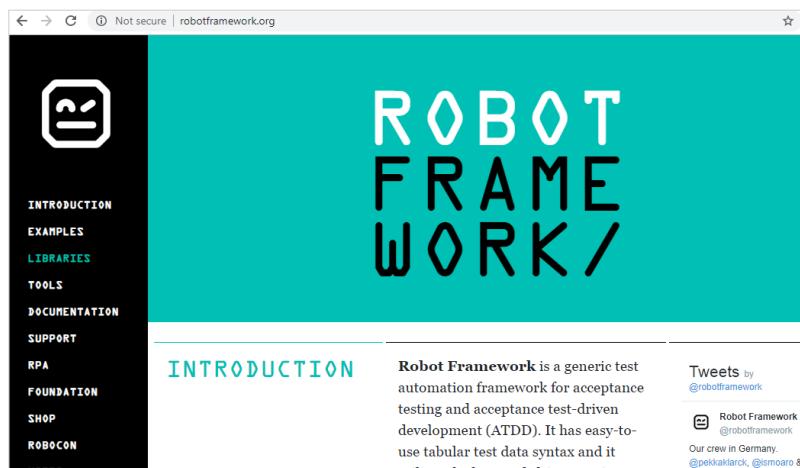

## 18. Robot Framework — Working With External Database libraries

Robot

We have seen how we can work with Selenium Library. The detailed installation/importing of Selenium Library is discussed in chapter "Working with Browsers using Selenium Library".

In this chapter, we will discuss database library and how to connect and test database using Robot Framework.

Go to Robot framework site <http://robotframework.org/> and click **Libraries** as shown below:

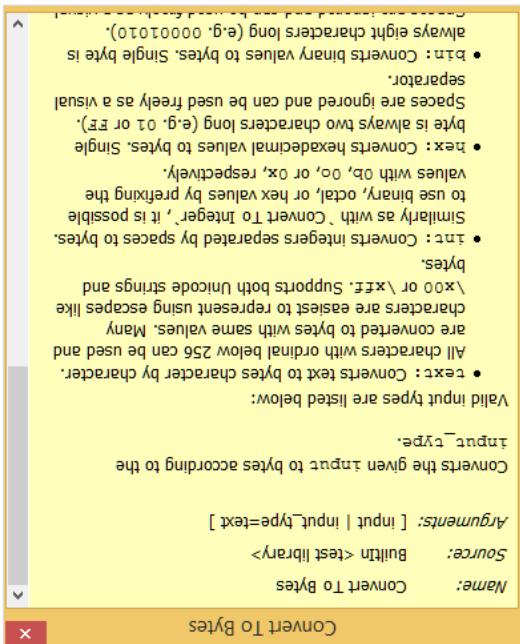

Let us now make some changes that will lead to the failure of the test case fail and see the output.

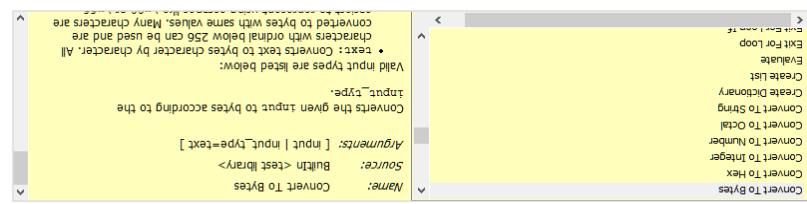

A screenshot of a test case configuration interface. The title bar says 'TC1'. On the left, there are sections for 'Documentation' (containing 'My first test case in ride'), 'Setup' (empty), 'Teardown' (empty), 'Tags' ('&lt;Add New&gt;'), 'Timeout' (empty), and 'Template' (empty). On the right, there's a table with numbered rows (1 through 8) and columns for 'Log', 'Description', and 'Setup'. Row 1: Log - 'Welcome to our first test case', Description - 'In robot framework', Setup - empty. Row 2: Log - 'In robot framework', Description - 'End of the test case', Setup - empty. Row 3: Log - 'End of the test case', Description - empty, Setup - empty. Rows 4 through 8 are empty.

We have seen keywords related to string, numbers, log messages, which are available with robot framework by default. The same can be used along with external library and also can be used to create user-defined keyword to work with test-cases.

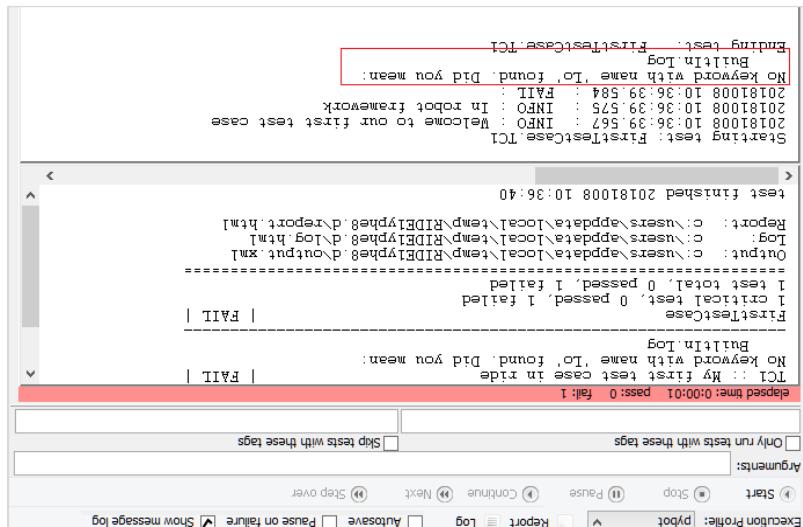

## Conclusion

It gives the details of each keyword with example in the corresponding window. When we click on the corresponding window, it will open separately as shown below:

We see that the test case has failed. I have highlighted the error that it tells about the test case.

In the above test case, the Log keyword is wrong. We will run the test case and see the output:

Robot

```

1 *** Variables ***
2 ${number}    100
3 ${name}      riya
4
5 *** Test Cases ***
6 TC1
7     Log  Hello World
8     Should Be True  ${number} == 100
9     ${str1}  Catenate  Hello  World
10    Log  ${str1}
11    ${a}  Set Variable  Hi
12    Log  ${a}
13    ${b}  Set Variable If  ${number}>0  Yes  No
14    Log  ${b}
15

```

Now, we will execute the test case to see the results:

Execution Profile: pybot

Arguments:

Elapsed time: 0:00:01 pass: 1 fail: 0

```

command: pybot.bat --argumentfile c:\users\ksana\appdata\local\temp\RIDEba9fv\d\argfile.txt --listener C:\Python27\lib\site-packages\StandardLibraryTest.py
=====
TC1
=====
| PASS |
StandardLibraryTest
| PASS |
=====
1 critical test. 1 passed. 0 failed
1 test total. 1 passed. 0 failed
=====
Output: c:\users\appdata\local\temp\RIDEba9fv\d\output.xml
Log:   c:\users\appdata\local\temp\RIDEba9fv\d\log.html
Report: c:\users\appdata\local\temp\RIDEba9fv\d\report.html
test finished 20181020 15:28:24

```

Starting test StandardLibraryTest TC1

20181020 15:28:24.384 : INFO : Hello World

20181020 15:28:24.393 : INFO : \${str1} = Hello World

20181020 15:28:24.393 : INFO : \${str1} = Hello World

20181020 15:28:24.393 : INFO : \${a} = Hi

20181020 15:28:24.393 : INFO : \${b} = Yes

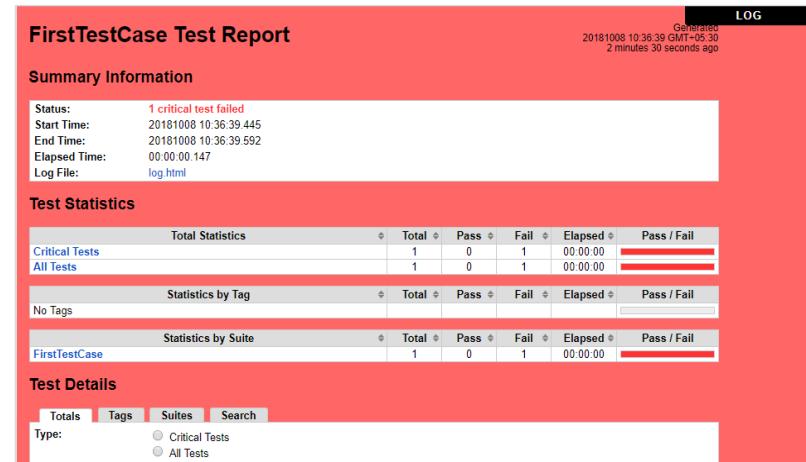

20181020 15:28:24.408 : INFO : \${b} = Yes

20181020 15:28:24.408 : INFO : \${b} = Yes

Ending test StandardLibraryTest TC1

When you write your keywords in tabular format, press ctrl + spacebar. It gives the list of built-in keywords available with Robot Framework.

Now will see the report and log output.From Report:

Following is the test code for above test cases from text edit:

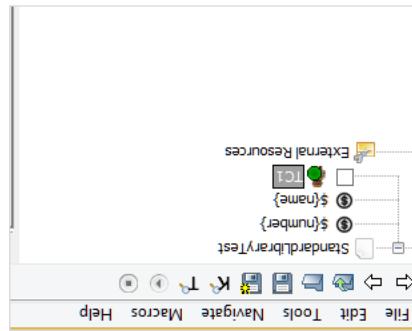

8	log								
7									
6									
5	log								
4									
3	log								
2	should Be True								
1	log								
0	No	Yes	\${{number}} < 0	Set Variable If	\${{number}}				

HERE:

There are three test cases used for comparing number, string, concatenate, etc. We have used simple keywords in the test cases below. The keywords are shown in tabular format

Variable	Value	Comment	\$number	\$name	rya
	100				

We have created 2 scalar variables - number and name as shown below:

We have created project in Ride and Test case as shown below:

We will work on a simple test case and will make use of built-in library in that.

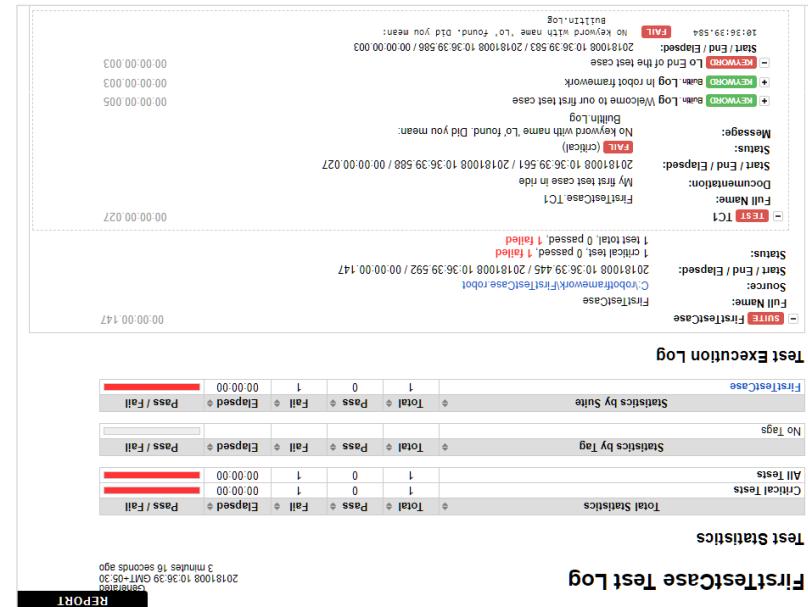

In this chapter, we will cover some of the important built-in keywords, which come with the Robot Framework. We can use these keywords along with external libraries for writing the test cases. We also have the built-in library available with Robot framework by default. It mostly used for verifications (for example - Should Be Equal, Should Contains, etc.).

## 17. Robot Framework — Working with Built-in Library

In this chapter, we covered a simple test case and the results seen during execution are shown. The reports and logs show the details of test case execution.

## **Conclusion**

When the test case fails, the color is changed to Red as shown above.

100

## 6. Robot framework — Writing and Executing Test Cases

Now, we will enter the keywords for test case.

The screenshot shows the RIDE IDE interface for creating a test case named 'TC1'. The 'Setup' section contains the command 'Open Browser | https://www.tutorialspoint.com | chrome | # setup to open browser'. The 'Teardown' section contains the command 'Close Browser | # teardown to close browser'. The 'Tags' section has a placeholder '<Add New>'. The 'Timeout' and 'Template' sections are empty. Below these, there is a table with 6 rows for test steps. Row 1 is highlighted in blue and contains 'Input Text' under 'Action', 'name=search' under 'Value', and 'This is coming from setup/teardown testcase' under 'Comment'. Rows 2 through 6 are empty. There are 'Edit' and 'Clear' buttons for each row.

We have only Input Text in the test case. The opening and closing of the browser is done from Setup and Teardown Settings.

### Test Execution Details

The screenshot shows the RIDE IDE's 'Run' tab with the 'Execution Profile' set to 'pybot'. The 'Arguments' section includes 'Only run tests with these tags' and 'Skip tests with these tags'. The log output shows the execution of the test case 'TC1'. It starts with the command 'python bot --argumentfile c:\users\kavash\appdata\local\temp\RIDEid4bhi\argsfile.txt --listener C:\Python27\lib\site-packages\robotframework\log\listener.py'. The test step 'Setupandteardowntest' passes. The test step 'TC1' also passes. The 'Setupandteardowntest' step has 1 critical test, 1 passed, 0 failed. The 'TC1' step has 1 test total, 1 passed, 0 failed. The log concludes with 'test finished 2018/02/28 11:54:02'. The output and report paths are listed as 'Output: c:\users\appdata\local\temp\RIDEid4bhi\d\output.xml', 'Log: c:\users\appdata\local\temp\RIDEid4bhi\d\log.html', and 'Report: c:\users\appdata\local\temp\RIDEid4bhi\d\report.html'.

### Conclusion

Setup and teardown play a crucial role in the testing world. We have seen how to use setup and teardown in our test cases and also how they are executed.

In this chapter, we will learn how to write and execute test cases. We would cover the following areas in this chapter:

- Project Setup
- Importing Libraries
- Write test case in tabular format
- Using Tags for Executing Test Case
- Use Resource Files for Test Case

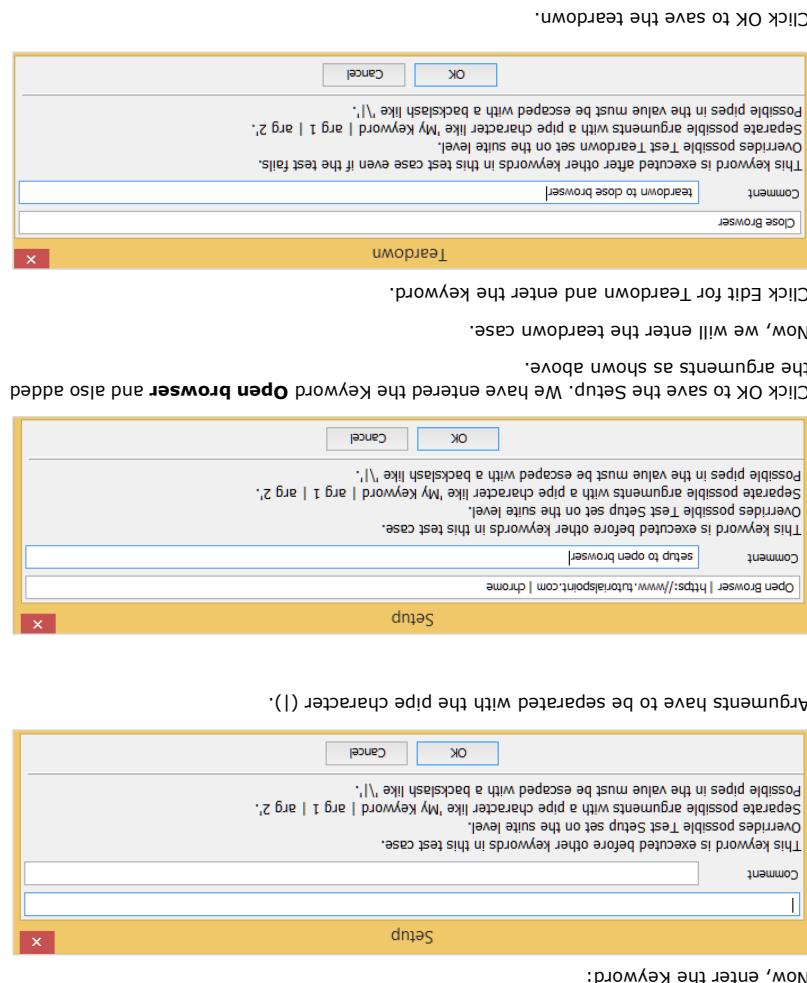

### Project Setup

Run the command ride.py to start RIDE IDE.

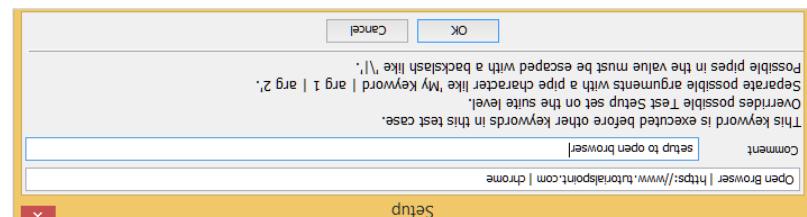

### Command

```
ride.py
```

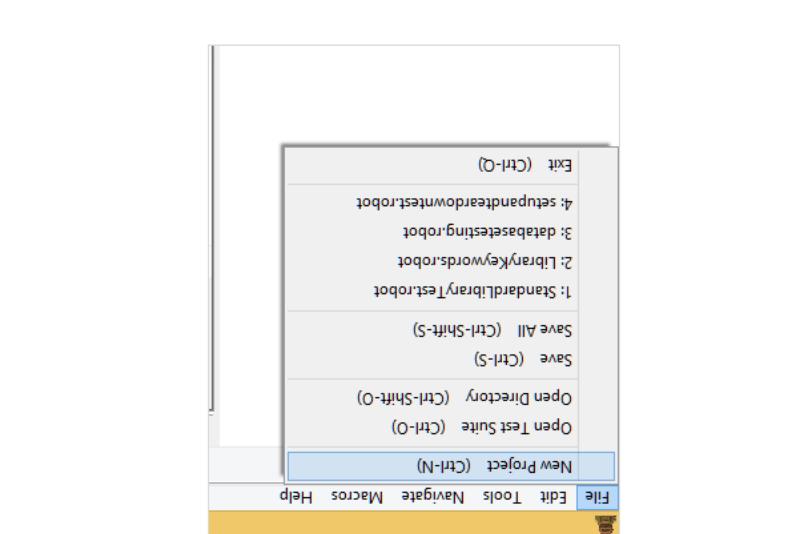

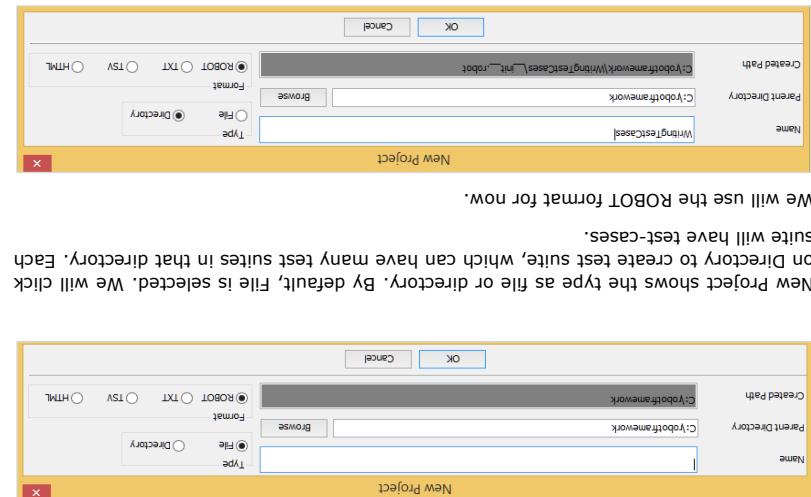

Arguments have to be separated with the pipe character (!).

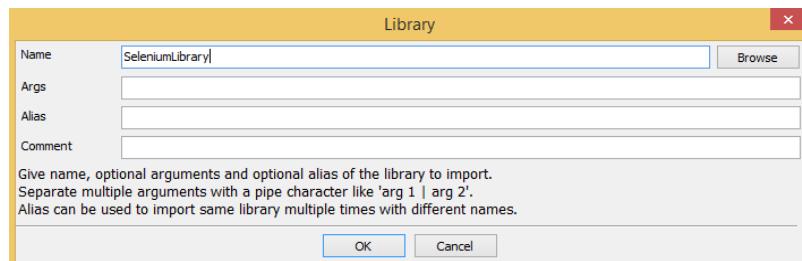

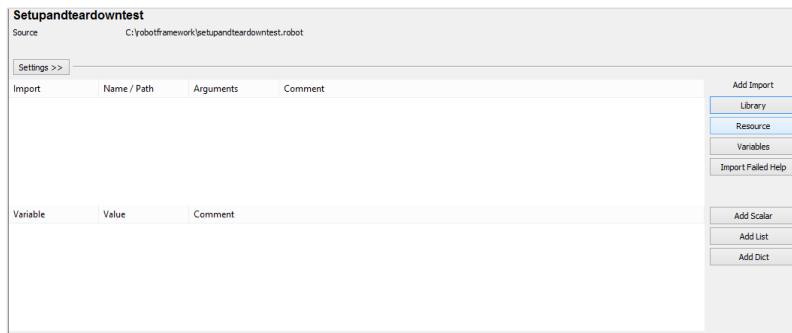

Click on **File -> New Project** as shown below:

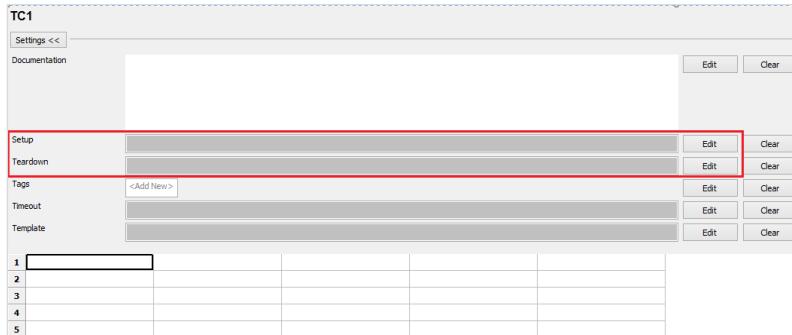

## Robot

To import the library, click Library:

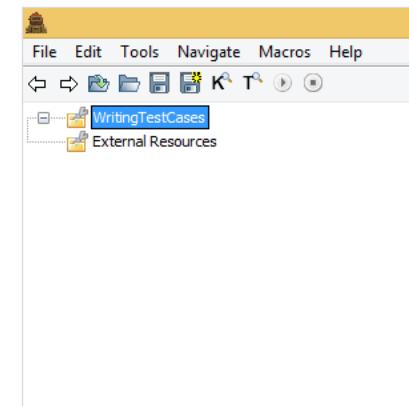

Click OK to save the library.

In the above screenshot, the Settings section has *Setup* and *Teardown* options. For Setup, click **Edit** to enter the keyword.

## Robot

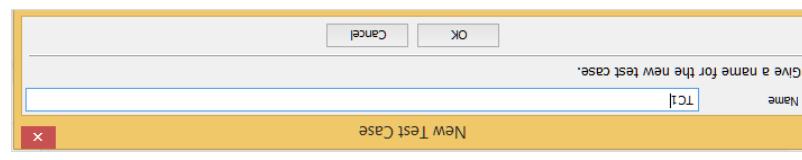

The Parent-Directory is the path where the *WritingTestCases* directory will be created. Click OK to save the test suite directory.

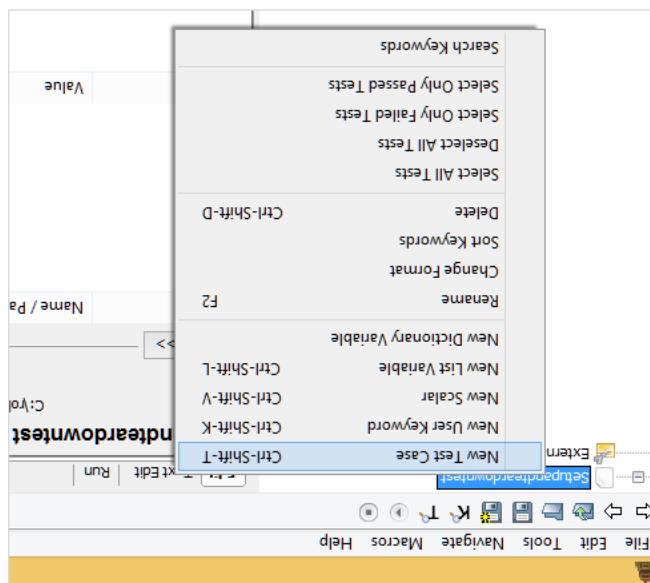

Right-click on the directory created and click on *New Suite*. You can also create sub directories with test suites in that.

Now we need to import the Selenium library to use the keywords related to browser and interact with the pages.

Click OK to save the test case.

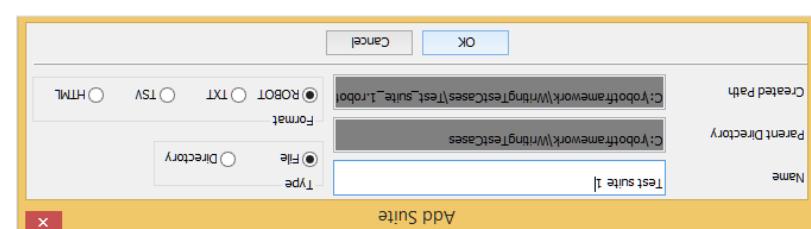

Click **New Test Case** to create one.

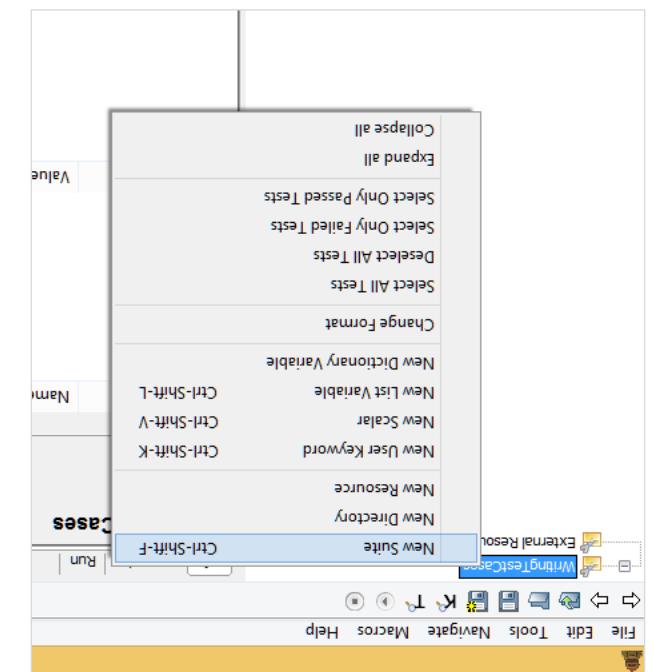

Click **OK** to save the project.

Robot

Click **OK** to save the Test suite.

For now, we will start with Test Suite creation as shown below:

Robot

# 16. Robot Framework — Working With Setup And Teardown

Robot

In this chapter, we will understand two important concepts of testing world — setup and teardown.

## Setup

This is a set of keywords or instruction to be executed before the start of test suite or test case execution.

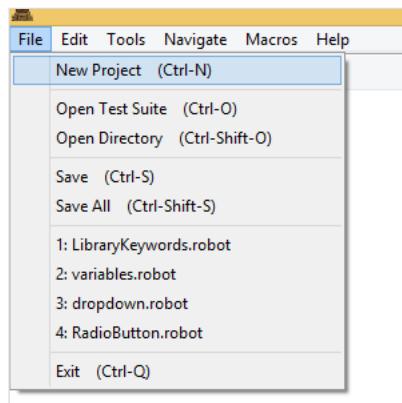

## Teardown

This is a set of keywords or instruction to be executed after the start of test suite or test case execution.

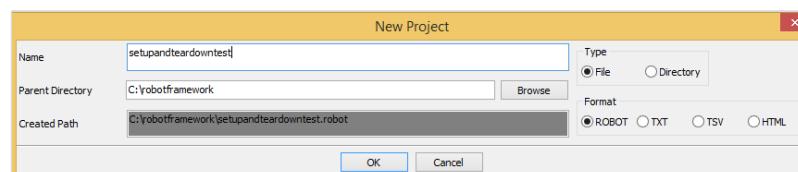

We will work on a project setup, where will use both setup and teardown. The opening and closing of browser are the common steps in test cases.

Now, we will add keyword **open browser** in the setup and close browser in teardown.

Open Ride using **ride.py** command from command line and create a new project.

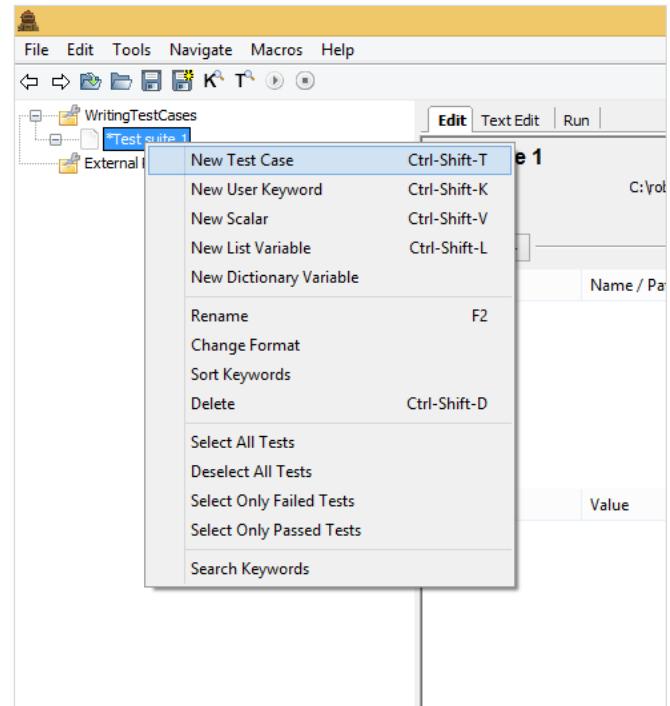

Click **New Project** to create project.

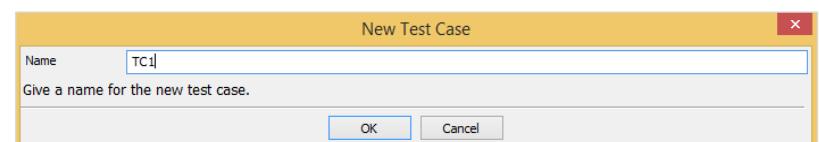

171

Now you can add test case to the suite. Right-click on the Test suite created as shown below:

Click **New Test Case**. It will display the screen to add name of the test case as shown below:

Click OK to save the test case. We have the project setup ready.

## **Conclusion**

We can use command line to execute robot test cases. The details of the test case passes or fail are displayed in the command line along with log and report URLs.

Robot Framework has its own built-in library, which need not be imported. But we need to interact with the browsers, databases, etc. To interact, we need to import the libraries.

The list of external libraries supported by robot framework are listed on robot framework official site as shown below:

Importing Libraries

100

To import a library, we need to click main project. To the right, the setting will display the Add Import option as shown below:

Click Library and enter the name of the library as shown below:

Click Ok to save the library.

We will run one of the test created from the folder as shown below:

The output, log and report paths are displayed at the end as shown above.

The settings will be displayed in the settings as shown below:

robot

The screenshot shows a software interface for managing test cases. At the top, there's a toolbar with icons for 'File', 'Edit', 'Test Case', 'Run', and 'Help'. Below the toolbar is a menu bar with 'Variable', 'Value', 'Comment', 'Import/Export', 'Help', 'Library', 'Arguments', 'Comments', 'Add Import', 'Library', 'SelenuimLibrary', 'Imports', 'Resource', 'Variables', 'Add Test', and 'Add DCT'. The main area is titled 'Test Suite 1' and contains a table with columns: 'Name / Path', 'Arguments', 'Comments', and 'Imports'. A row in the table has the path 'C:\yedoo\framework\Testing\testCases\set\run1' and the imports 'java.util.List'. At the bottom, there's a status bar with 'Test Case 1 Run' and a footer with 'Copyright © 2010 YEDOO'.

The screenshot shows a Windows application window titled "Win32 Test Cases". The main area contains a table with columns: Variable, Value, Comment, and Script. The table has three rows:

Variable	Value	Comment	Script
Add Dict			
Add List			
Add Set			

Below the table is a menu bar with the following items: File, Edit, View, Tools, Help. Under the Tools menu, there is a submenu with options: Import/Export, Variables, Routes, Library, and Add Support. At the bottom of the window, there is a status bar with the path "C:\Windows\system32\Win32TestCases" and a "Run" button.

Robot

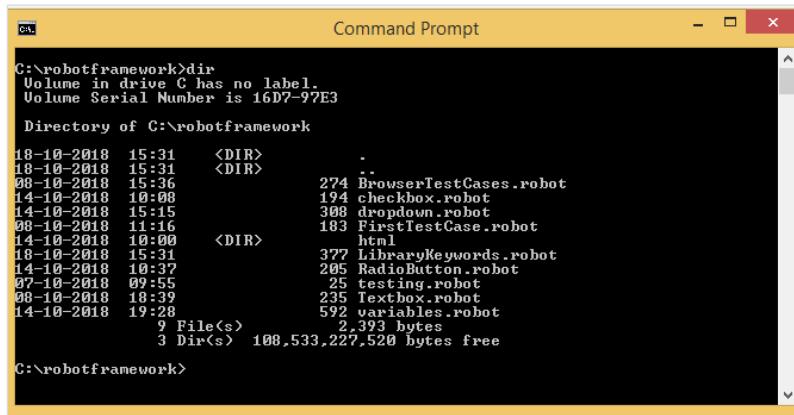

When you click on the test case on the left side, it will display the tabular format where you can enter the keywords. Now, you can use the built-in keywords and the keywords available from the selenium library.

# 15. Robot Framework – Working With Command Line

Robot

In this chapter, we will learn how to make use of the command line to run test cases.

To begin with, let us open the command prompt and go to the folder where your test cases are saved. We have created test cases and saved in the folder **robotframework** in C Drive.

```
C:\>robotframework>dir
Volume in drive C has no label.
Volume Serial Number is 16D7-97E3

Directory of C:\robotframework

18-10-2018  15:31    <DIR>          .
18-10-2018  15:31    <DIR>          274 BrowserTestCases.robot
08-10-2018  15:36          194 checkbox.robot
14-10-2018  10:08          308 dropdown.robot
14-10-2018  15:15          183 FirstTestCase.robot
08-10-2018  11:16          183 FirstTestCase.robot
14-10-2018  10:00    <DIR>          html

                           3 Dir(s)   108,533,227,520 bytes free

C:\>robotframework>
```

Test cases created so far are available in the folder **C:\robotframework**.

If you have saved your project as a file, the command is:

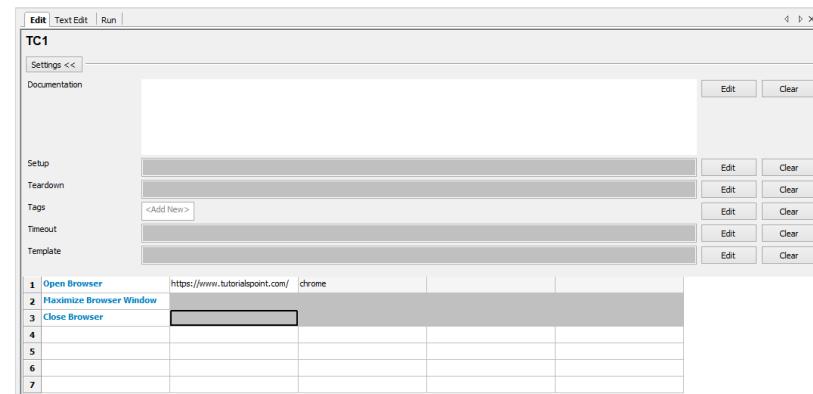

```
robot -T nameoftestcase.robot
```

If you have saved your project as a directory, the command is:

```
robot -T projectname testsuite
```

## Write test case in tabular format

Here is a simple test case, which opens the URL in chrome browser.

1	Open Browser	https://www.tutorialspoint.com/	chrome
2	Maximize Browser Window		
3	Close Browser		
4			
5			
6			
7			

The following shows the details of the test cases:

```
*** Settings ***
Library           SeleniumLibrary

*** Test Cases ***
TC1
  Open Browser  https://www.tutorialspoint.com/  chrome
  Maximize Browser Window
  Close Browser
```

We have seen how to create and use variables. There are three types of variables supported in robot framework - scalar, list and dictionary. We discussed in detail the working of all three variables.

**Textedit tab whenever required.**  
Simplarily, other variables - list and dictionary variables can be created directly inside

## **Conclusion**

Robot

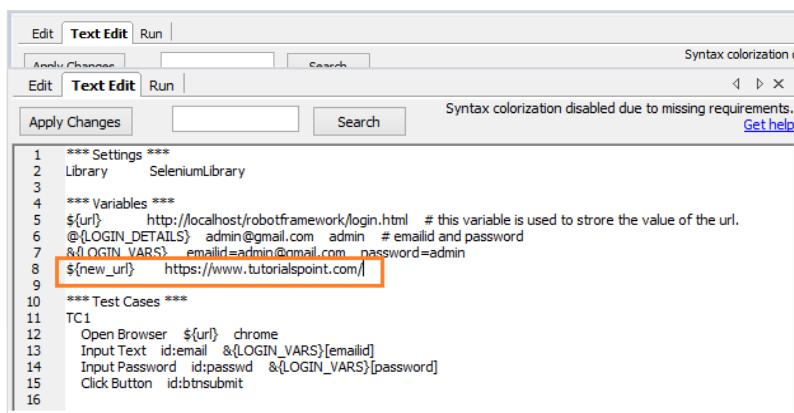

Robot

We will add one more test case: T22 in the same project.

**Test case**

1 Open Browser	\${url}	chrome	
2 Input Text	id:email	&{LOGIN_VARS}[emailid]	
3 Input Password	id:password	&{LOGIN_VARS}[password]	
4 Click Button	id:btssubmit		

We have used scalar variable and dictionary variable in the above test case. Here is the code so far in TextEdit; this is based on the test case written:

```

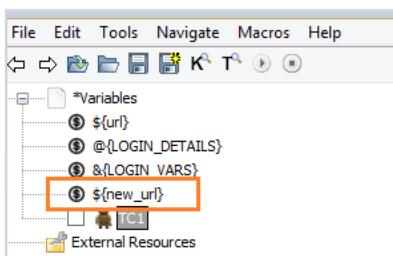

1 *** Settings ***
2 Library SeleniumLibrary
3
4 *** Variables ***
5 ${url} http://localhost/robotframework/login.html # this variable is used to store the value of the url.
6 @{LOGIN_DETAILS} admin@gmail.com admin # emailid and password
7 &{LOGIN_VARS} emailid=admin@gmail.com password=admin
8 ${new_url} https://www.tutorialspoint.com/
9
10 *** Test Cases ***
11 TC1
12 Open Browser ${url} chrome
13 Input Text id:email &{LOGIN_VARS}[emailid]
14 Input Password id:password &{LOGIN_VARS}[password]
15 Click Button id:btssubmit
16

```

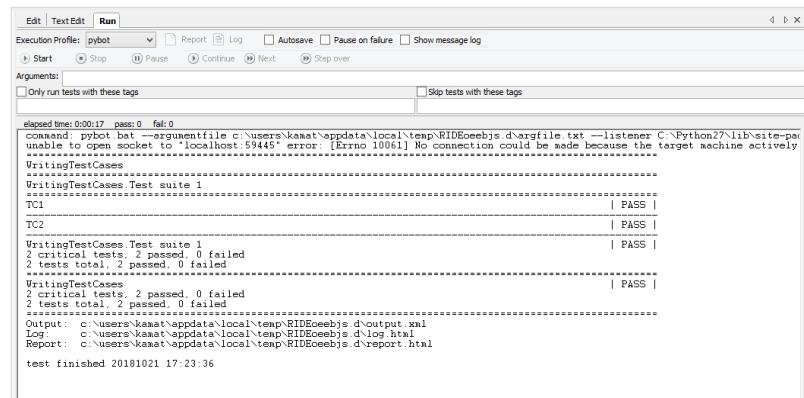

The variables used are highlighted in Red. We can also create variables we want directly in TextEdit as shown below:

We have added a scalar variable called  `${new_url}` and the value given is <https://www.tutorialspoint.com/>.

Click **Apply Changes** button on the top left corner and the variable will be seen under the project as shown below:

We can add multiple test cases under the test suite created. Click Run to execute the test cases. The execution will take place based on the number of test cases added:

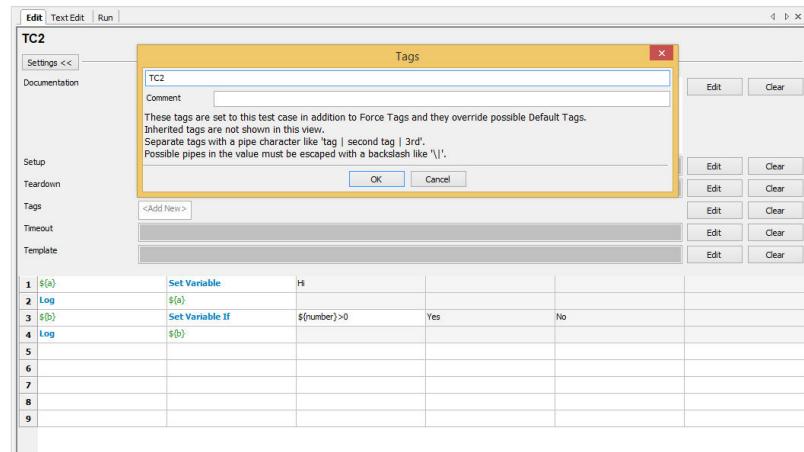

```

Edit Text Edit Run
Execution Profile: pybot v
Arguments:
Only run tests with these tags Skip tests with these tags
elapsed time: 0:00:17 pass: 0 fail: 0
command: pybot bat --argumentfile c:\users\kaast\appdata\local\temp\RIDEceebjs d\argfile.txt --listener C:\Python27\lib\site-packages\robot\reporter\html.py
unable to open socket to 'localhost:59445' error: [Errno 10061] No connection could be made because the target machine actively refused it
WritingTestCases
WritingTestCases Test suite 1
2 critical tests, 2 passed, 0 failed
2 tests total, 2 passed, 0 failed
=====
WritingTestCases
2 critical tests, 2 passed, 0 failed
2 tests total, 2 passed, 0 failed
=====
test finished 20181021 17:23:36

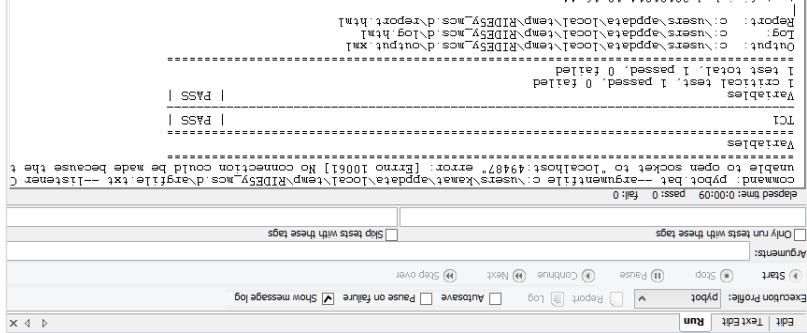

```

**Using Tags for Executing Test Case**

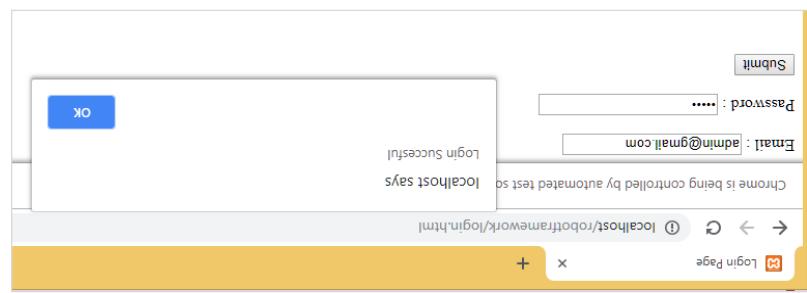

In case you want to run only test case TC2, you can tag the same. Click on the test case and click Edit across Tags as shown below:

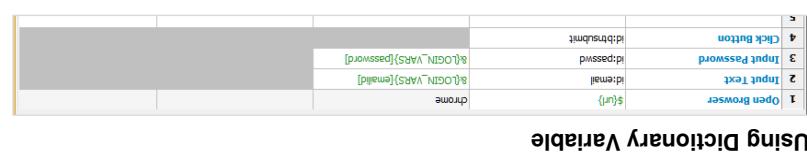

We have seen the Edit and Run Tab so far. In case of TextEdit, we have the details of the test case written. We can also add variables required in TextEdit.

The execution details are as follows:

Upon clicking run, we get the following:

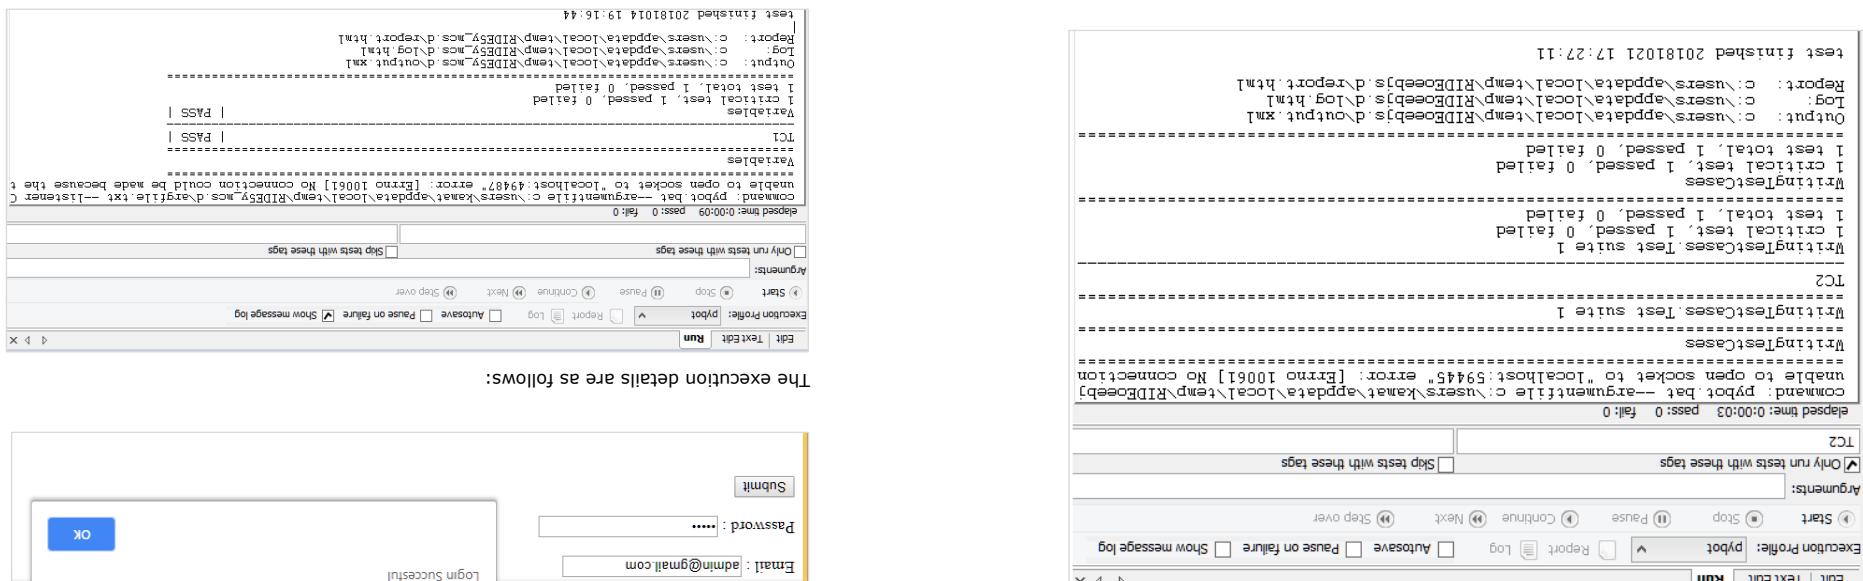

We will change to dictionary variable as shown below.

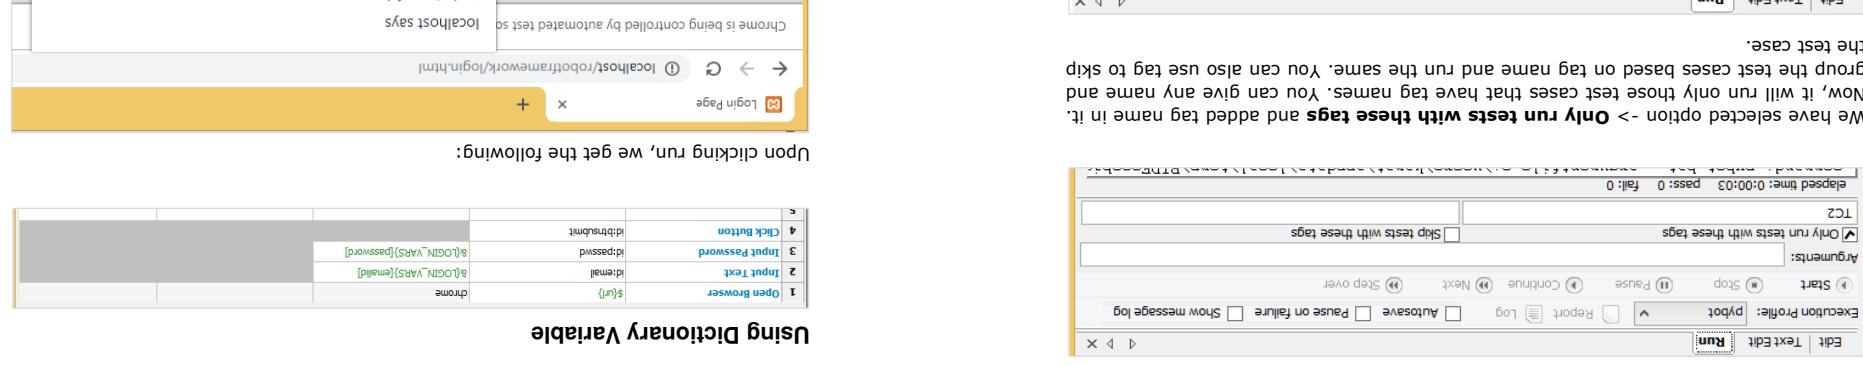

Robot framework has option for resource, where you can import robot files to be used with the test cases.

### Use Resource Files for Test Case

Now we can see only TC2 running when executed.

We have selected option -> Only run tests with these tags and added tag name in it. Now, it will run only those test cases that have tag name and run the same. You can give any name and group the test cases based on tag name. You can also use tag to skip the test case.

Click OK to save the tag. Add the tag name in Run as shown below:

Robot

Variable	Value	Comment
\${url}	http://localhost/robotframework/login.html	# this variable is used to store the value of the url.
@{LOGIN_DETAILS}	admin@gmail.com   admin	# emailid and password
&{LOGIN_VARS}	emailid=admin@gmail.com   password=admin	

We will change the test case to take the dictionary values.

1	Open Browser	\${url}	chrome	
2	Input Text	id:email	@{LOGIN_DETAILS}[0]	
3	Input Password	id:passwd	@{LOGIN_DETAILS}[1]	
4	Click Button	id:btnsubmit		
5				

163

Robot

Test case TC1 that we have created uses the following keywords:

1	Open Browser	https://www.tutorialspoint.com/   chrome	
2	Maximize Browser Window		
3	Close Browser		
4			
5			
6			
7			
8			

We have used Keywords like:

- Open Browser
- Maximize Browser Window
- Close Browser

We will use a user-defined keyword for the above test case. The user-defined keyword will be available in the robot file which will be used as a resource.

We will create a file in the same directory and write our keyword as follows:

Please note details of keywords, i.e., how to create user-defined keywords are explained in *Robot Framework - Working with Keywords* chapter.

We have created a user-defined keyword called **Test Browser** as shown in the *browseropen.robot* file:

```
*** Settings ***
Library           SeleniumLibrary

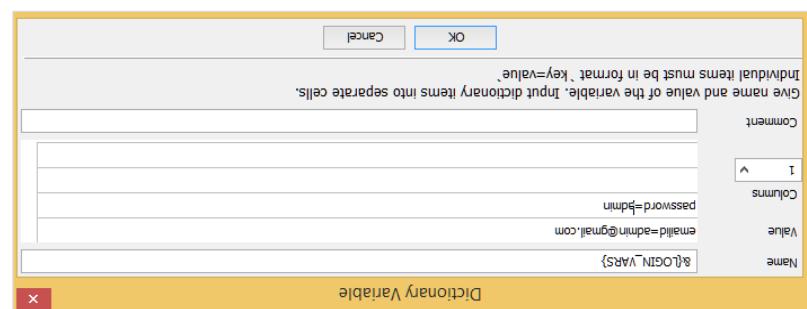

*** Variables ***
${url}          https://www.tutorialspoint.com/
${browser}        chrome

*** Keywords ***
Test Browser
    Open Browser    ${url}    ${browser}
    Maximize Browser Window
```

The file contains various options such as Settings, Variables, and Keywords. Please note, we cannot write test case inside the file to be used as resource. We will upload the above file as resource for the test suite as shown below.

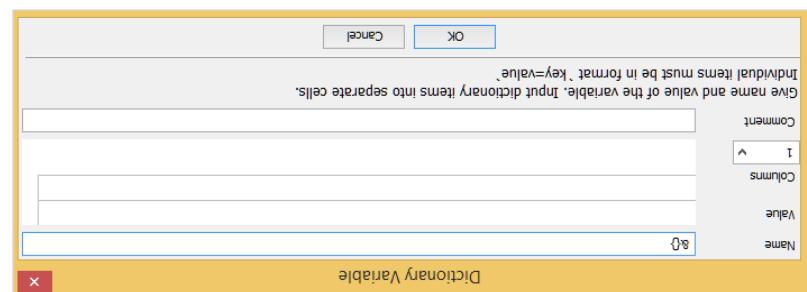

52

The Name by default in the screen is **LOGIN\_VARS** and it has Value and Columns option.

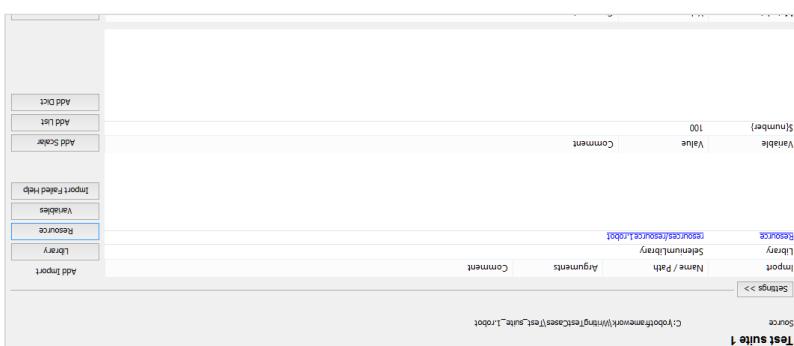

We will enter the Name and the Values to be used in the test case.

The Name by default in the screen is **{}{}** and it has Value and Columns option.

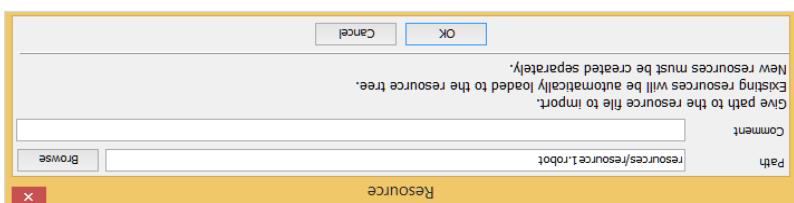

Upon clicking **New Dictionary Variable**, a screen will appear as shown below:

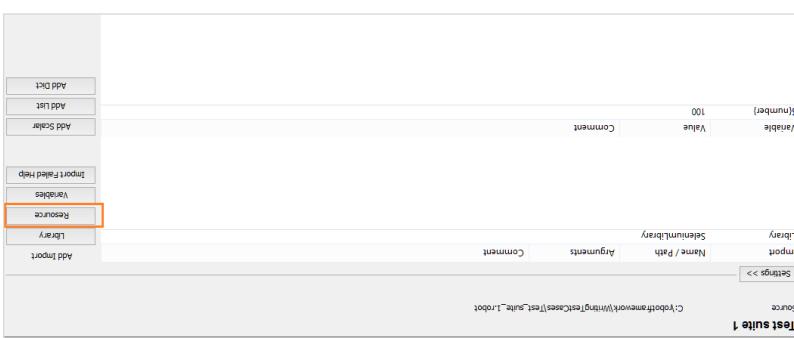

Robot

Mention the path where the file is stored as shown above and click OK to add resource. It will be displayed as shown below:

Click on Resource and it will ask the path to import robot file:

Select the test suite. On the left side, click on resource option as shown below:

Robot

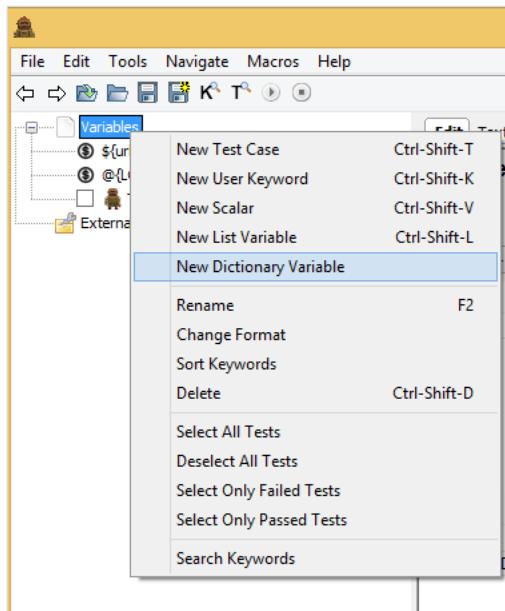

Robot

Suppose we are storing the values as key1=A, key2=B. It will be referred in the test case as :

```
&{Variablename}[key1] // A
&{Variablename}[key2] // B
```

Let us create dictionary variable in Ride.

Right-click on Project and click on *New Dictionary Variable*.

Robot

Now, we will change test case TC1 which has keywords as shown below:

1	Open Browser	https://www.tutorialspoint.com/	chrome
2	Maximize Browser Window		
3	Close Browser		
4			
5			
6			
7			
8			

We will add the user-defined keyword to TC1 from the resource file, i.e., Test Browser keyword:

1	Test Browser	
2	Close Browser	
3		
4		
5		
6		
7		

The resource file uploaded is as shown below:

```

WritingTestCases
  └── Test suite 1
    ├── ${number}
    └── └── TC1
    └── └── TC2
  └── Resources
    ├── browseropen.robot
    ├── resource1.robot
    └── └── resource1.robot
      ├── ${url}
      ├── ${browser}
      └── Test Browser
  └── External Resources

```

```

1 *** Settings ***
2 Library SeleniumLibrary
3
4 *** Variables ***
5 ${url} https://www.tutorialspoint.com/
6 ${browser} chrome
7
8 *** Keywords ***
9 Test Browser
10 Open Browser ${url} ${browser}
11 Maximize Browser Window
12

```

The user-defined Keyword is used in test case TC1.

## Syntax

Dictionary Variable is similar to list variable wherein we pass the index as an argument; however, in case of dictionary variable, we can store the details - key value form, it becomes easier to refer when used in the test case instead of using the index as 0, 1, etc.

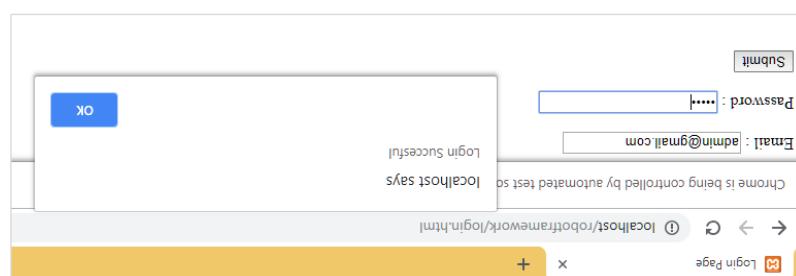

## Dictionary Variable

In our next section, we will learn about the Dictionary Variable.

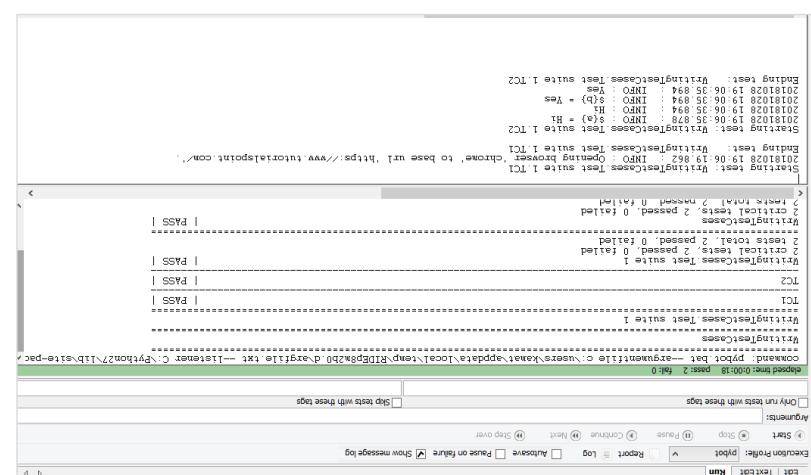

The following screenshot shows the execution details for the same:

It has taken the email id and password from the list variable as shown above in the test screen.

Now, we will execute the test case to see if it is taking the values from the list variable:

Robot

We will now execute the test case:

The details of variables used are listed in the settings tab:

The screenshot shows the 'Variables' section of the Robot Framework Settings tab. It lists two imports: 'Import' (SeleniumLibrary) and 'Library' (SeleniumLibrary). Below these, there is a table for variables:

Variable	Value	Comment
\${url}	http://localhost/robotframework/login.html	# this variable is used to store the value of the url.
@\${LOGIN_DETAILS}	admin@gmail.com   admin	# emailid and password

Now, we will add the list variable inside the test cases as shown below.

Here, we have hardcoded values for the Input Text and Password. Now, we will change it to use the list variable.

1	Open Browser	\${url}	chrome	
2	Input Text	id:email	admin@gmail.com	
3	Input Password	id:passwd	admin	
4	Click Button	id:btsubmit		
5				

### Using List Variable

1	Open Browser	\${url}	chrome	
2	Input Text	id:email	@\${LOGIN_DETAILS}[0]	
3	Input Password	id:passwd	@\${LOGIN_DETAILS}[1]	
4	Click Button	id:btsubmit		
5				

We have both test cases being passed. Let us now see the report and log details.

### Report

#### WritingTestCases Test Report

Generated  
20181028 19:06:35 GMT+05:30  
1 minute 35 seconds ago

##### Summary Information

Status:	All tests passed

Totals	Tags	Suites	Search
Type:	<input type="radio"/> Critical Tests	<input checked="" type="radio"/> All Tests	

## List Variable

List variable will have an array of values. To get the value, the list item is passed as the argument to the list variable.

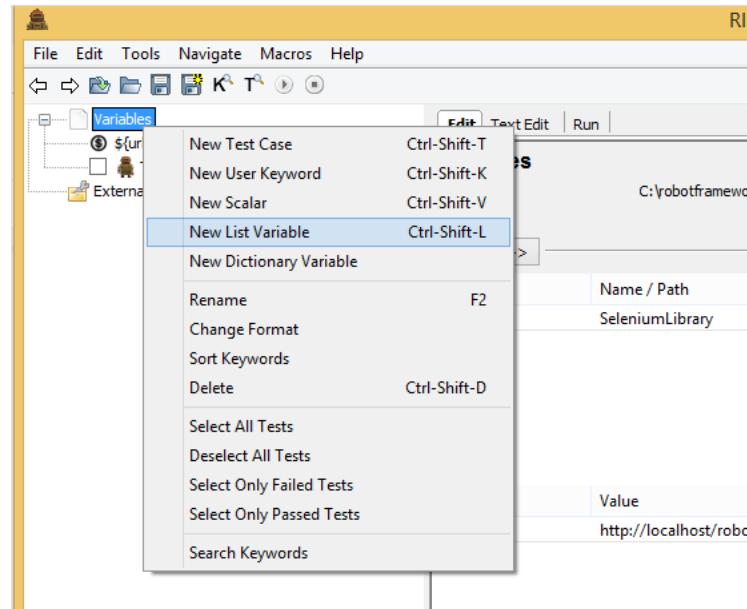

### Syntax

```
@{variablename}
```

Suppose we have values A, B. To refer the values, we need to pass the list item as follows:

```
@{variablename}[0] // A
@{variablename}[1] // B
```

To add list variable, right-click on the project and click **New List Variable**.

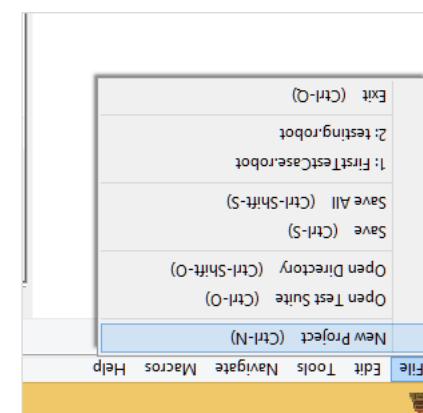

The advantage of using variables is that you can change the value for that variable and it will be reflected in all test cases. You can use the variables in many test cases that you create under that project. Hardcoding of values can be a serious problem when you want to change something. You will have to go to individual test cases and change the values for it. Having variables in one place gives us the flexibility to test the way we want with different values to the variables.

Now, we will look into the next type of variable called the List variable.

Click on **New Project** and give a name to your project.

Will be reflected in all test cases. You can use the variables in many test cases that you create under that project. Hardcoding of values can be a serious problem when you want to change something. You will have to go to individual test cases and change the values for it. Having variables in one place gives us the flexibility to test the way we want with different values to the variables.

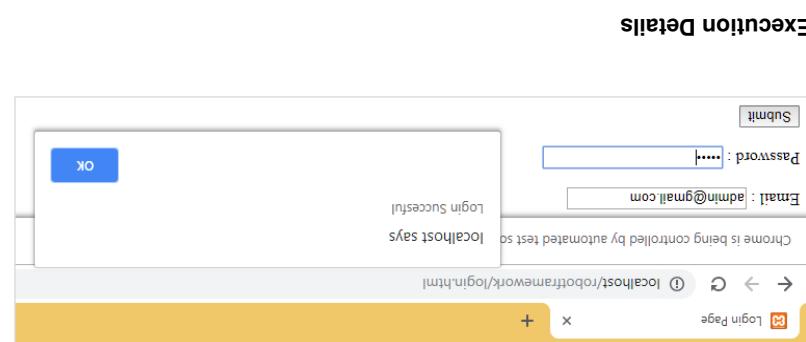

We will do a project setup to show the working of keyword driven style.

## Keyword Driven Style

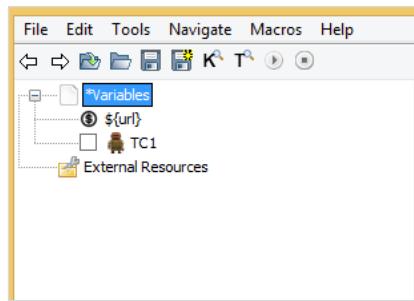

- Keyword Driven style
  - Data Driven style
- The workflow of a test-case can be tested using keyword or data driven style. In case you want to test the workflow with different inputs, the same can be done using data driven test cases. We will work on an example to go through the following test case approaches:

## 7. Robot framework — Keyword and Data Driven Test Cases

Robot

The variable name is shown under the project created as follows:

Let us now use the scalar variable created inside our test case.

### Test case with URL hardcoded

1	Open Browser	http://localhost/robotframework/lo chrome		
2	Input Text	id:email	admin@gmail.com	
3	Input Password	id:passwd	admin	
4	Click Button	id:btnsubmit		
5				

In the above test case, we have to replace the URL with the variable we just created above.

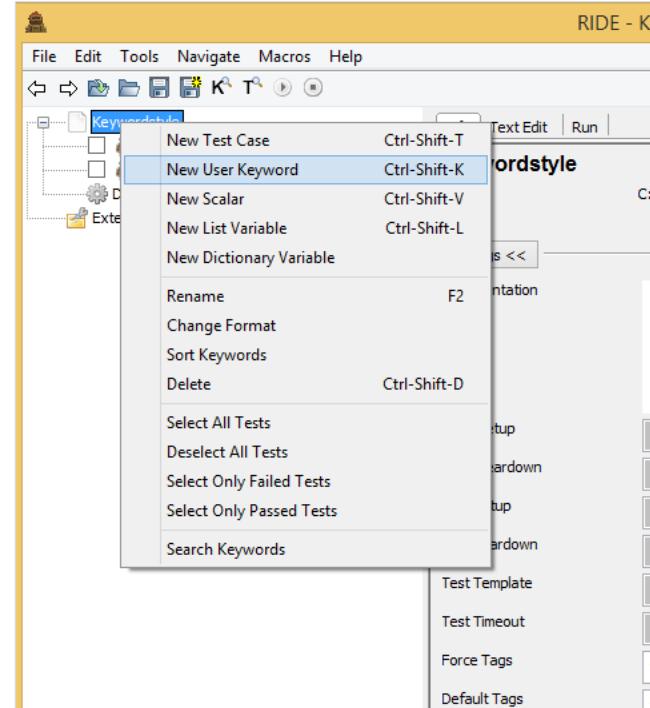

### Test Case with Scalar Variable for URL

1	Open Browser	\${url}	chrome	
2	Input Text	id:email	admin@gmail.com	
3	Input Password	id:passwd	admin	
4	Click Button	id:btnsubmit		
5				

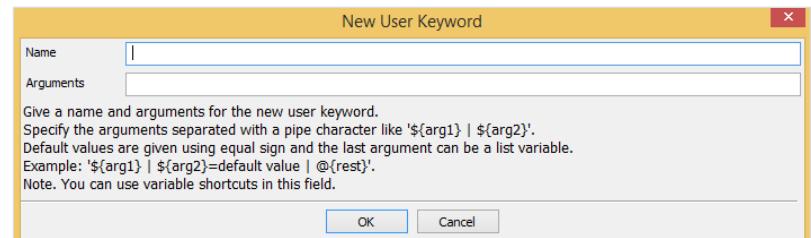

Now, we will run the test case to see if it is taking the URL from the variable. Below is the output that we get when we run it. The URL <http://localhost/robotframework/login.html> is picked up from the scalar variable we created.

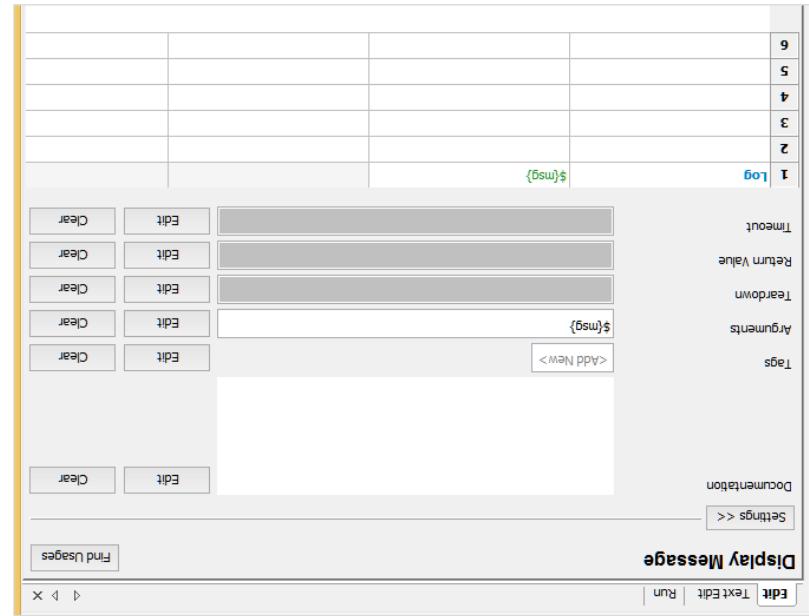

The name given to the project is keywordstyle. Click **OK** to save the project. In this project, we will create a user keyword as shown below.

Right-click on the name of the project and click on *New User Keyword* as shown below:

It will display screen as follows:

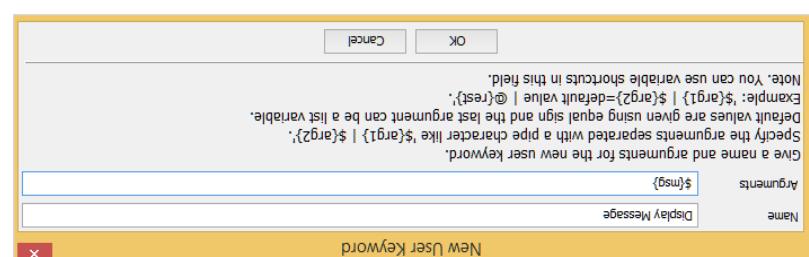

Here, we will use a simple Log keyword available with Robot Framework as shown below:

```
Log ${msg}
```

or built-in keywords available with Robot Framework.

So, it will have a tableular format as shown below where we can give the Library keywords do.

example the argument will be a scalar variable \${msg}.

it will log a message. So we need to give an argument to it. Therefore, in the above the keyword as **Display Message**. The role of Keyword **Display Message** is, when it is called, here we will give name of the keyword and the arguments it will take. Here we will give name of the keyword and the arguments it will take.

Here we need to enter the name of the variable inside the curly braces as shown in the screen below:

Scalar Variable

Name	\${url}
Value	http://localhost/robotframework/login.html
Comment	this variable is used to store the value of the url.

Give a name and value of the variable.

The name of the variable is \${url}. The value is http://localhost/robotframework/login.html. Click OK to save the scalar variable. The details of the variable are added as shown below:

We added the comment as shown above. Click OK to save the scalar variable. The details of the variable are added as shown below:

Here we need to enter the name of the variable inside the curly braces as shown in the screen below:

Scalar Variable

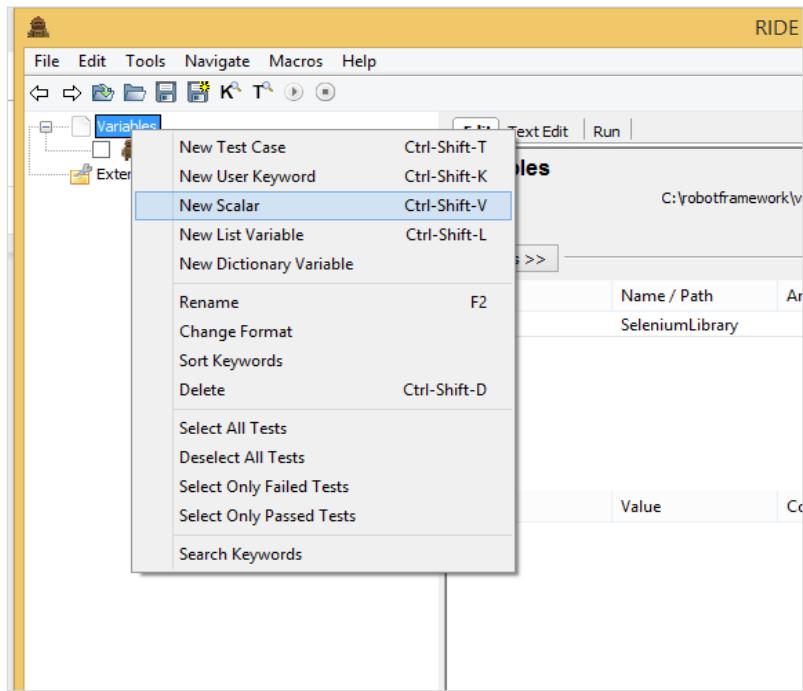

Name	\${url}
Value	http://localhost/robotframework/login.html
Comment	this variable is used to store the value of the url.

Give a name and value of the variable.

The name of the variable is \${url}. The value is http://localhost/robotframework/login.html. Click OK to save the scalar variable. The details of the variable are added as shown below:

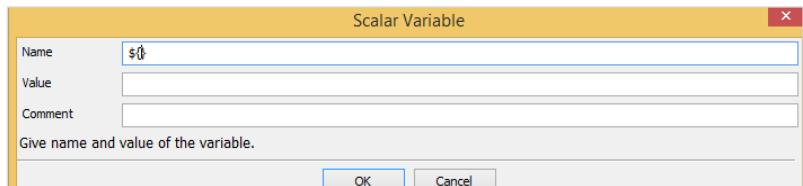

We added the comment as shown above. Click OK to save the scalar variable. The details of the variable are added as shown below:

To create scalar variable, right-click on your project and click on *New Scalar* as shown below:

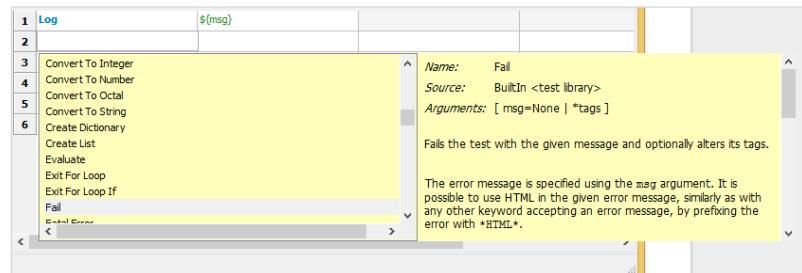

Clicking on *New Scalar* will open the following screen to create the variable and the value we need to replace with when the variable is used inside test cases.

We get \${} for the Name field.

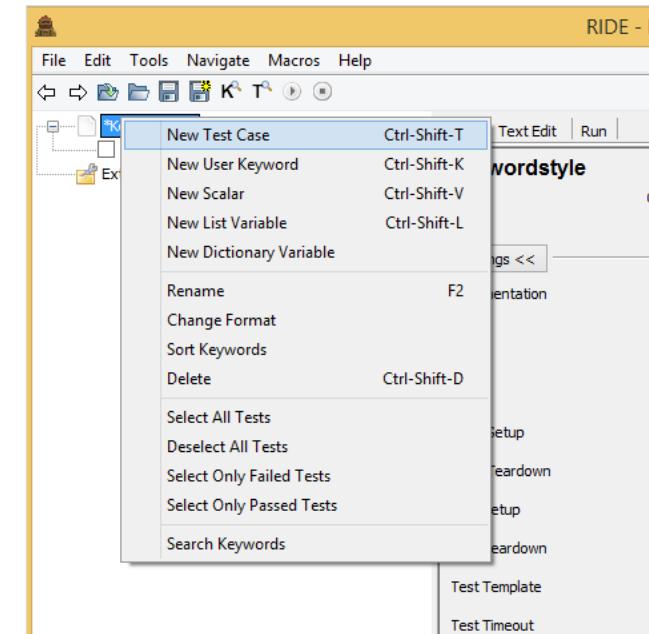

To get more keywords available with Robot framework, press ctrl + space bar in the table column as shown below:

So the keyword we want to use with our testcase is ready. The name of the user keyword is *Display Message* and it takes one argument called \${msg}.

Let us now use this keyword in simple keyword driven style test-case. To do that we need to create test case. Right-click on the name of the project created. Now, click *New Test Case*:

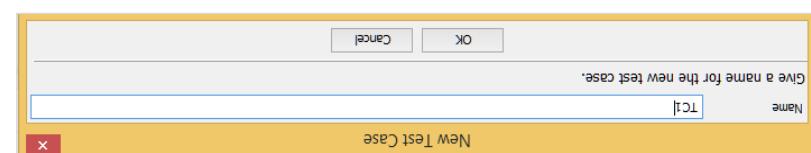

We have used the keyword we have created as shown above and passed the value Hello World.

1	Display Message	Hello World
2	Open Browser	http://localhost/dotframework/HelloWorld
3	Input Text	id:email admin@gmail.com
4	Click Button	id:submit Submit
5		

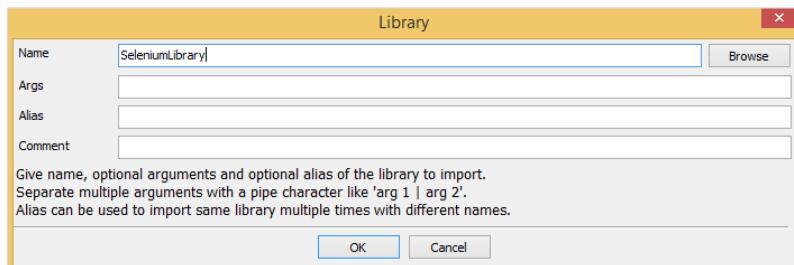

In the test case, we have used the user-defined keyword **Display Message** in the tabular format as shown below:

In the test case, we have used the user-defined keyword **Display Message** in the tabular format as shown below:

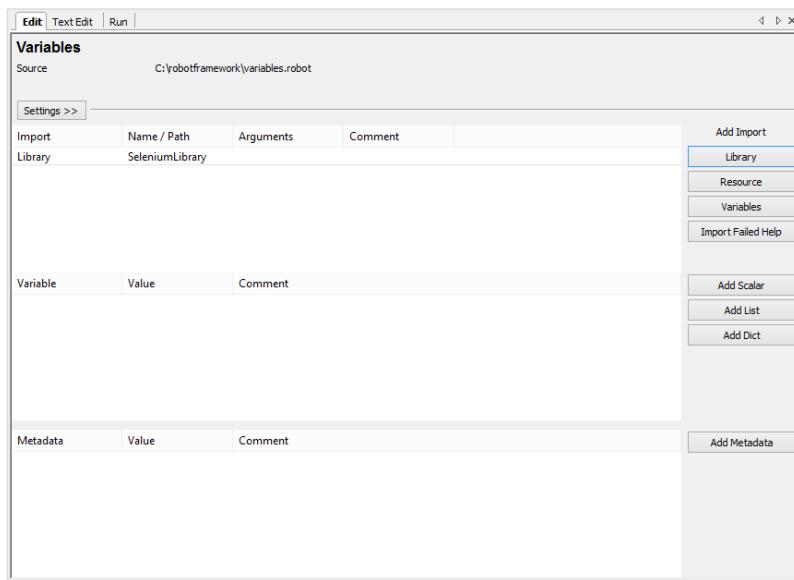

## Robot

Upon clicking Library, a screen will appear where you need to enter the library name:

Click OK and the library will get displayed in the settings.

The name given has to match with the name of the folder installed in site-packages.

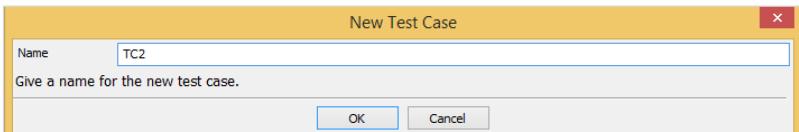

We will execute the test case TC1 and check the output:

```
elapsed time: 0:00:01 pass: 1 fail: 0
command: pybot.bat --argumentfile c:\users\kamat\appdata\local\temp\RIDEcdkk0i.d

Starting test: Keywordstyle.TC1
20181027 12:35:41.490 : INFO : Hello World
Ending test: Keywordstyle.TC1
```

In the above example, we have written a simple test-case which logs message and the test case is executed with output *Hello World*. We can see the output Hello World printed in the log. The test case is also passed here.

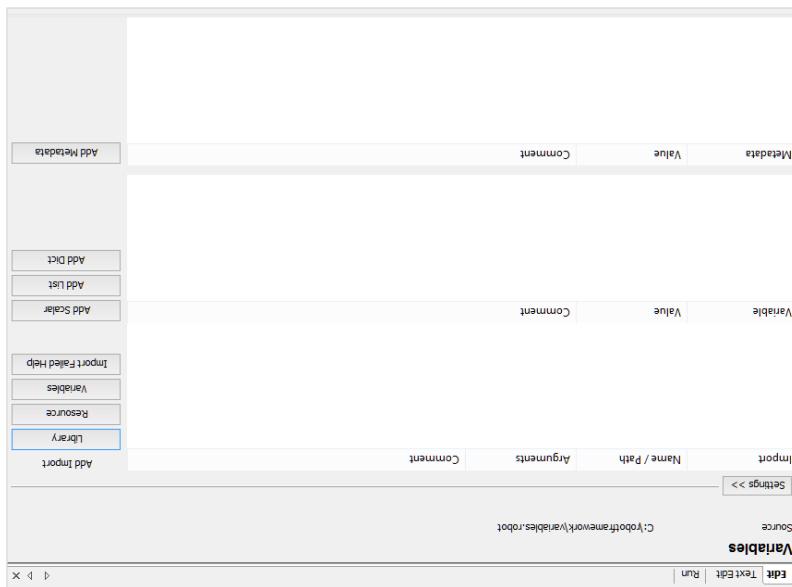

## Data Driven Style

We will create one more test case in the same project. We will give the name of the test-case as TC2.

To work with data driven style, we need to create template. Template will take the name of the high level keyword, which is a user-defined keyword like the one we created at the start called *Display Message*. The arguments to that template will be sent in the form of test-cases. We can pass different values to that template keyword. The data driven approach is mostly used when you want to test the scenario with different data to it.

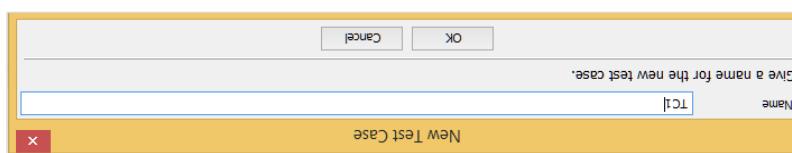

Once the test case is saved. Click on the test case and the display will be as follows:

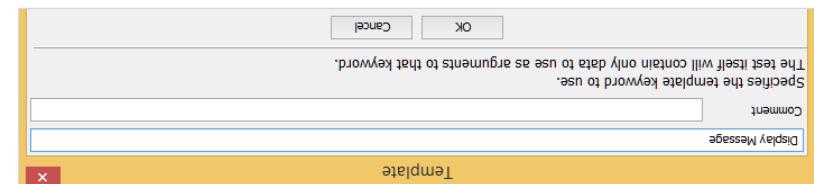

Click on your project on the left side and use Library from Add Import:

We are done with the project setup and now will write test cases for the scalar variables to be used in our test case. Since we need Selenium library, we need to import the same in our project.

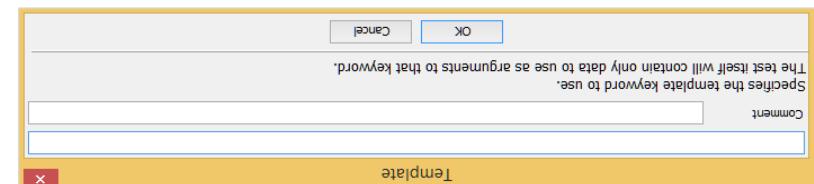

Give a name to the test case and click OK.

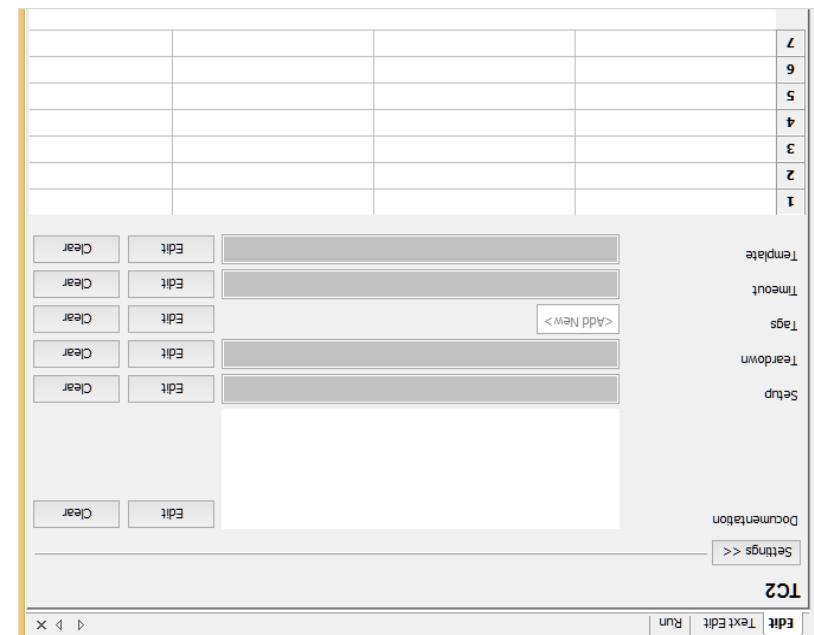

Robot

Enter the user keyword for the template and click OK to save the template.

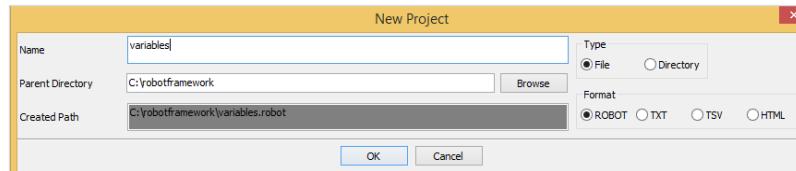

Click on Edit button for Template and add the user-defined keyword.

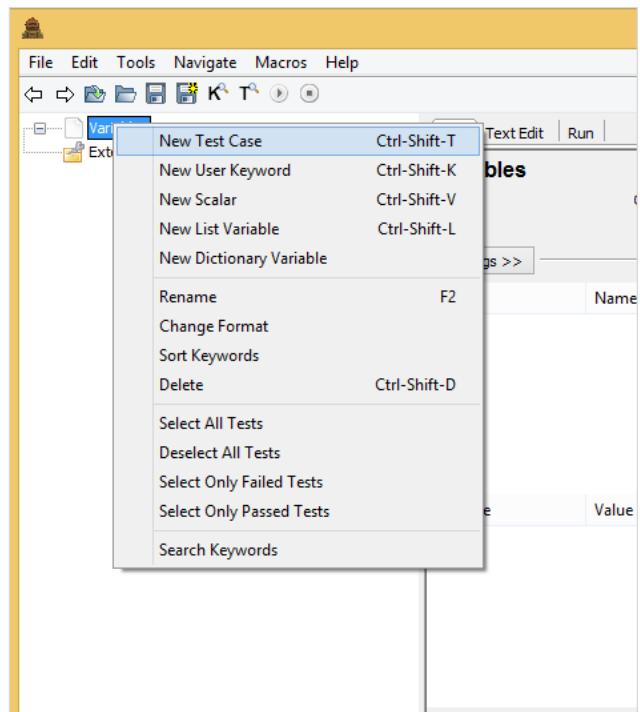

Robot

Now, give a name to your project.

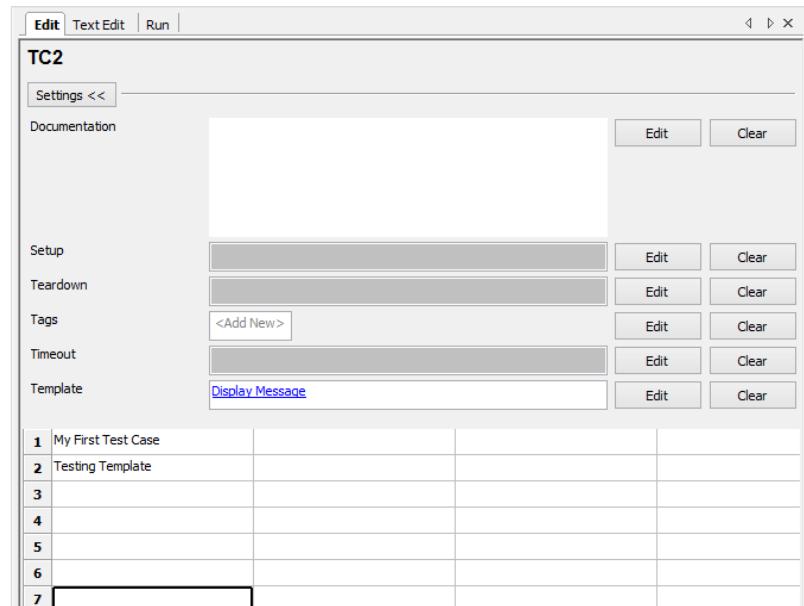

The name given is *variables*. Click OK to save the project.

Right-click on the name of the project created and click on *New Test Case*:

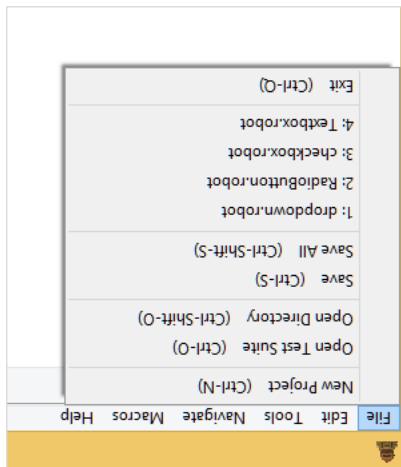

*Display Message* keyword takes one argument called \${msg}. This is a scalar variable. The details passed in this test case will act as arguments to the user-defined keyword *Display Message*.

In TC2, we have added Template *Display Message* (user-defined keyword). We have given messages in the tabular format.

Click **New Project**.

Open RIDE using **ride.py** in the command line and create a new project.

We can use scalar variable to store strings, objects, lists, etc. We will first create a simple test case and make use of scalar variable in it.

Scalar variables will be replaced with the value they are assigned. The syntax for scalar variable is as follows:

`{variableName}`

We will understand the working of each of this variable with the help of test cases in Ride.

### Scalar Variable

- Dictionary Variable
- List Variable
- Scalar Variable

We are going to discuss following variables available in Robot Framework

Variables are used to hold a value, which can be used in test cases, user-defined keywords, etc.

In this chapter, we will discuss how to create and use variables in Robot Framework.

We have used keyword style and data driven style in this chapter and seen the working of both. Data Driven style takes high-level user-defined keyword as a template and all the test cases act as values to the template.

### Conclusion

For T2C, we used Display Message as a Template. We passed `My First Test Case` and `Testing Test Case` as values in T2C. As the user keyword Display Message uses internally `Log keyword`, it displays the message in the log as shown above.

This was the message we had given to the user keyword Message.

We can see Run executes both the Test Cases. The output shown for T2C is Hello World.

```

Starting test: KeywordStyle.TC1
2018027 12:47:14.424 : INFO : Hello World
Ending test: KeywordStyle.TC1

Let us now execute the test case.

Robot

## 14. Robot Framework – Working With Variables

## 8. Robot — Working With Browsers Using Selenium Library

Upon successful execution, the above test case generates the following output:

### Conclusion

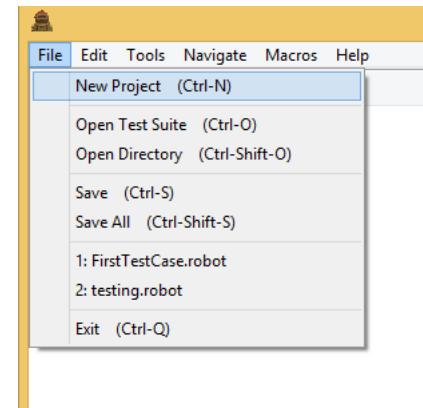

In this chapter, we have seen how to get help for built-in keywords. We have also seen how to create user-defined keywords, which can be a combination of library keywords and built-in keywords.

In this chapter, we will learn how to work with browsers using Robot Framework and Selenium Library in ride.

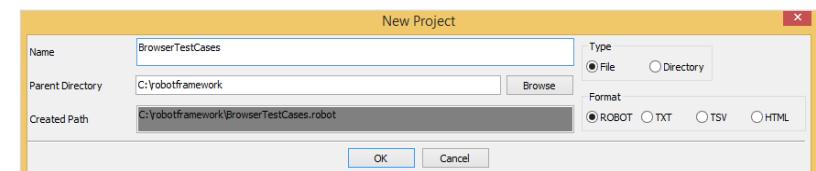

- Project setup in Ride
- Import Selenium Library
- Test case using Chrome Browser
- Test case using Firefox Browser

### Project Setup In Ride

We will first create a project in Ride to work with browsers. Open ride using ride.py from the command line.

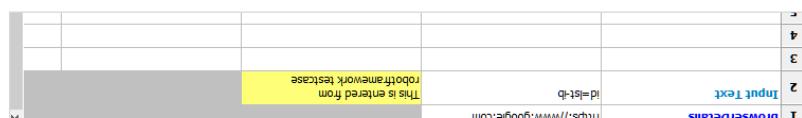

Click on *New Project* and give name to your project.

The name given is BrowserTestCases. Click OK to save the project. Right-click on the name of the project created and click on *New Test Case*:

Let us run the above test case and see the output.

We have changed the argument to Input Text to the id of the input field. You can inspect and check in the browser. To get the URL for keyword BrowserDetails is changed to <https://www.google.com>.

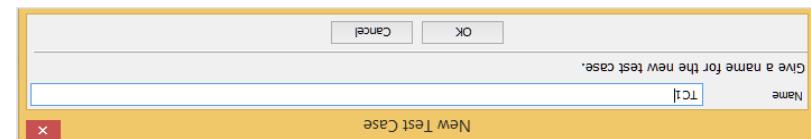

Let us now change the URL; we will use <https://www.google.com>.

The keyword and the arguments passed to the user-defined keyword are working fine.

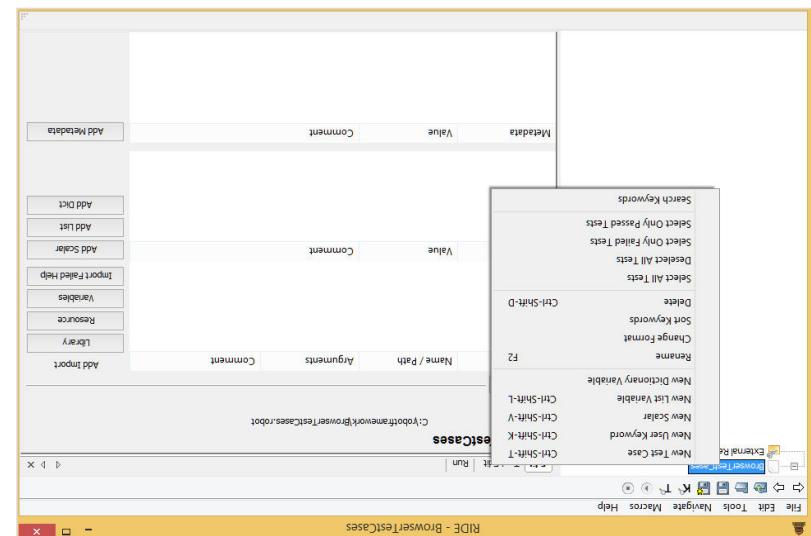

Let us now run the test case to see the output:

Robot

Give name to the test case and click OK.

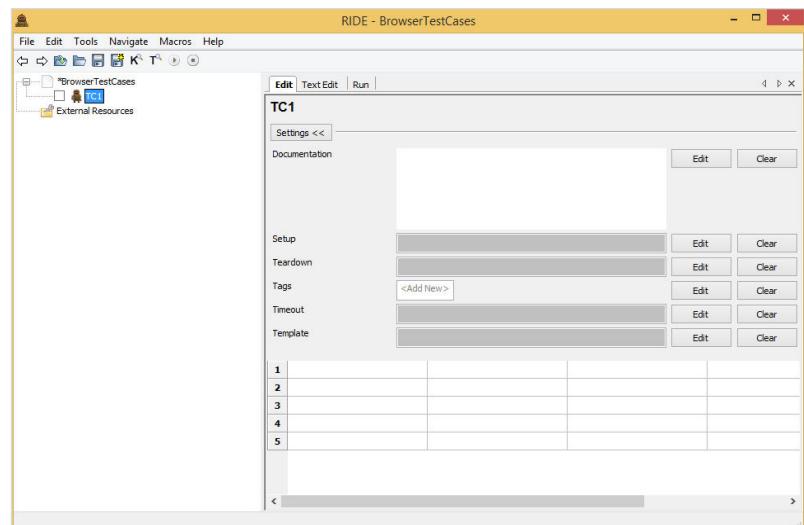

Robot

Robot

Following are the details for keyword BrowserDetails:

Robot

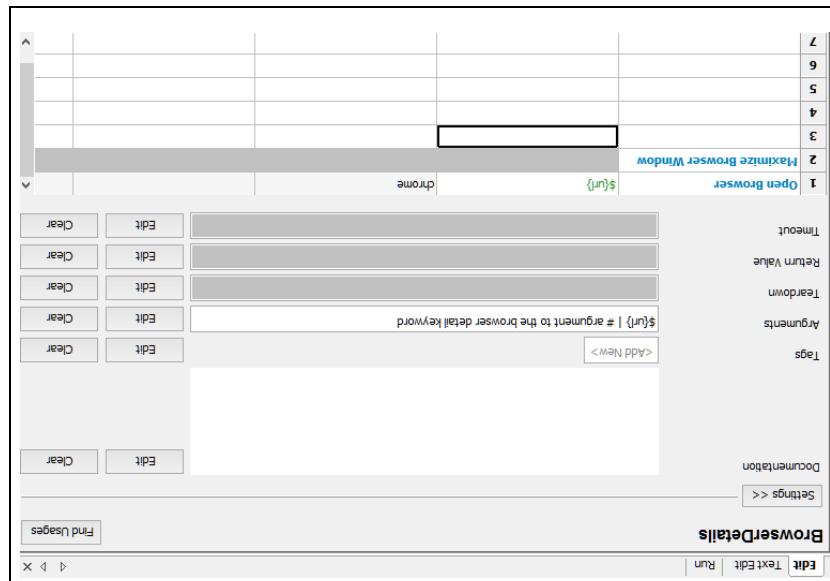

We are done with the project setup. Now, we will write test cases for the browser.

The test case now will have the URL to be passed as argument.

1	BrowserDetails	https://www.tutorialspoint.com	
2	Input Text	name=search	This is entered from robotframework testcase
3			
4			

17

In the test case, when you type the user-defined keyword is the URL to be used for the test case. Now, you need to pass the value which is the URL to be used for back to your test case. In the details of the keyword along with the arguments, it gives the test case, when you type the user-defined keyword and press Ctr + Spacebar, it

To work with browsers, we need selenium library to be imported in robot. We can do that as follows:

1000

On the left side, select the LIBRARIES option.

tabular test data syntax and it utilizes the keyword-driven testing approach. Its testing capabilities can be extended by test libraries

**Robot Framework** is a generic test automation framework for acceptance testing.

# ROBOT FRAME WORK

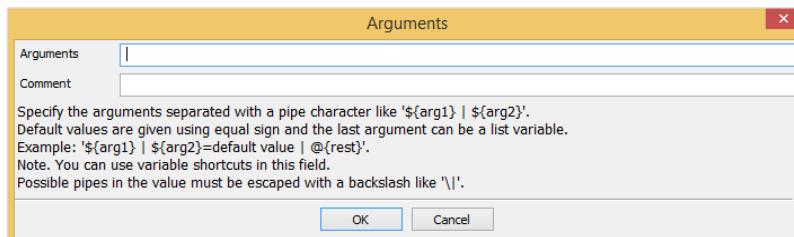

INTRODUCTION	EXAMPLES	LIBRARIES	TOOLS	DOCUMENTATION	RPA	FOUNDATION	SHOP	ROBOCON	USERS
--------------	----------	-----------	-------	---------------	-----	------------	------	---------	-------

Not secure | robotframework.org

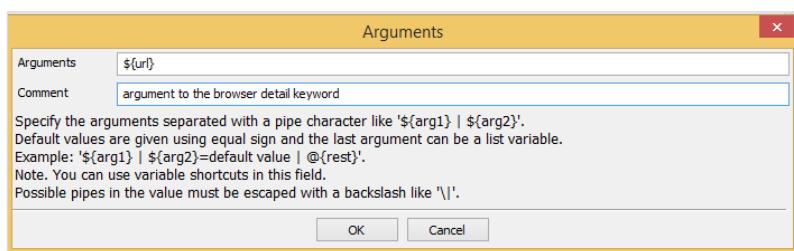

as follows:

Robot

Click on Edit against the Arguments.

Enter the argument to be used with the keyword.

If there is more than 1 argument, you can separate them using pipe (|). We will now use the argument in the Keyword specified as follows:

STANDARD	EXTERNAL	OTHER
Builtin	Dialogs	Collections
Provides a set of often needed generic keywords. Always automatically available without imports.	Provides means for pausing the test execution and getting input from users.	Provides a set of keywords for handling Python lists and dictionaries.
OperatingSystem	Remote	Screenshot

Select External option from above and it will list you all the libraries available to be used.

We can see arguments to help us with the hardcoded parameters. We will go back to the browser under the project. The keyword contains the URL of the browser hardcoded. If we replace the name of the keyword is `BrowserDetails`, we can use this keyword in our test cases want to use the keyword in another test case with a different URL, it will not be possible.

We can use arguments to help us with the hardcoded parameters. We will go back to the keyword created under the project. The keyword contains the URL of the browser hardcoded. If we want to use the keyword in another test case with a different URL, it will not be possible.

www.english-test.net

The screenshot shows a browser window with the following details:

- Title Bar:** Maximize Browser Window
- Address Bar:** https://www.tutorialspoint.com
- Page Content:** BrowserDetails
- Bottom Navigation:** Find Usage Details, Settings >>
- Right Side:** A vertical sidebar with numbers 1 through 5.

Here is the keyword that we created:

KUDU

1000

Now, we will use the keyword created in the test case as shown below.

### Test case

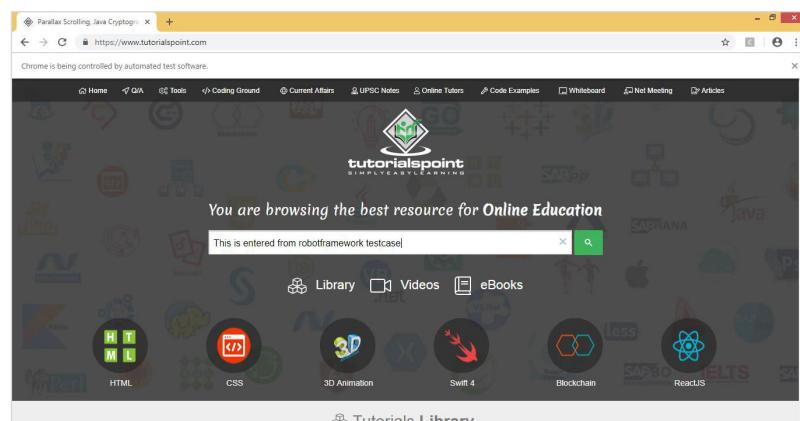

1	Open Browser	https://www.tutorialspoint.com	chrome
2	Maximize Browser Window		
3	Input Text	name=search	This is entered from robotframework testcase

Considering the above test case, we are going to use the user-defined keyword `BrowserDetails`.

We will now replace 1 and 2 keywords with the user-defined keyword:

1	BrowserDetails		
2	Input Text	name=search	This is entered from robotframework testcase
3			

Let us now run the test case to see the output:

The execution of the test case works perfectly fine.

Now, we will see the use-case of arguments in keywords.

You will be redirected to the github repo as shown below:

See keyword documentation for available keywords and more information about the library in general.

### Installation

The recommended installation method is using pip:

```
pip install --upgrade robotframework-seleniumlibrary
```

Running this command installs also the latest Selenium and Robot Framework versions, but you still need to install browser drivers separately. The --upgrade option can be omitted when installing the library for the first time.

Those migrating from Selenium2Library can install SeleniumLibrary so that it is exposed also as Selenium2Library:

```
pip install --upgrade robotframework-seleniumlibrary
```

The above command installs the normal SeleniumLibrary as well as a new Selenium2Library version that is just a thin wrapper to SeleniumLibrary. That allows importing Selenium2Library in tests while migrating to SeleniumLibrary.

To install the last legacy Selenium2Library version, use this command instead:

```
pip install robotframework-selenium2library==1.8.0
```

With recent versions of pip it is possible to install directly from the GitHub repository. To install latest source from the master,

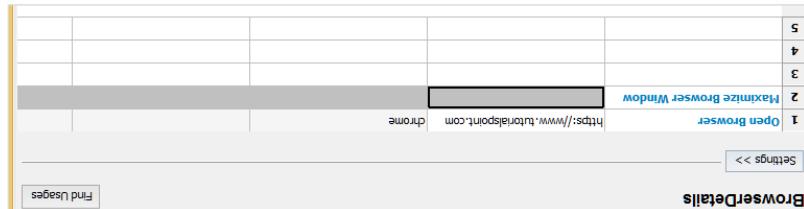

For Installation of seleniumlibrary, we can use the command from the github and install it using pip.

### Command

```
pip install --upgrade robotframework-seleniumlibrary
```

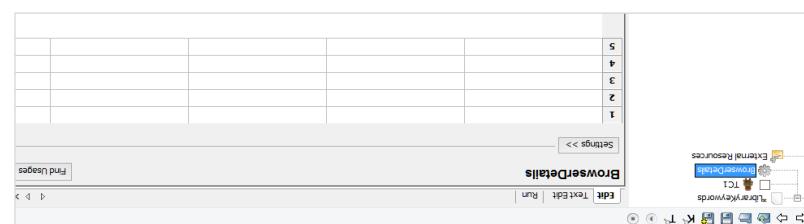

```
C:\> pip install --upgrade robotframework-seleniumlibrary
Collecting robotframework-seleniumlibrary
  Downloading https://files.pythonhosted.org/packages/74/e9/19f4f96e1f35ed34e5f9d06d8285f981d2b8c5e7efa23d5c201c4650d732/robotframework_seleniumlibrary-3.2.0-py2.py3-none-any.whl (79kB)
     100% ##### 81kB 405kB/s
Collecting selenium>=3.4.0 (from robotframework-seleniumlibrary)
-
```

Our BrowserDetails keyword is a combination of other keywords used repeatedly.

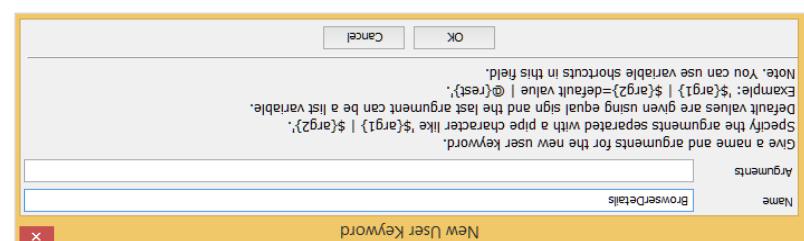

Now, we will create a user-defined keyword that will have open browser and maximize browser details. The keyword created will be used in our test case.

To test the URL in the browser, we repeatedly have to enter open browser, **maximize browser** keywords.

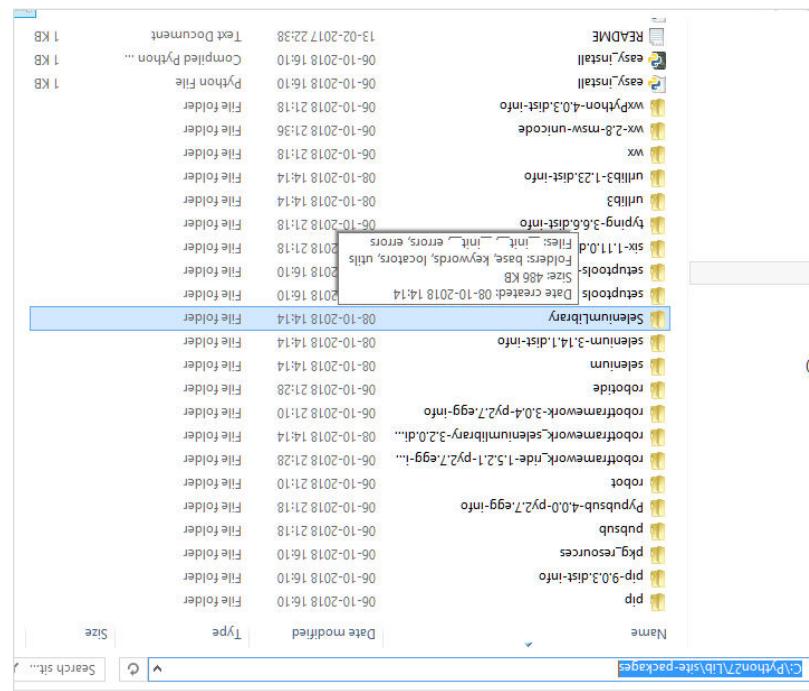

We have given the name BrowserDetails to the keyword. Click OK to save it. The keyword BrowserDetails is created.

Enter the Name of the keyword and click OK. The screen also shows Arguments. We will discuss what arguments have to do with keywords in a subsequent section.

Once the installation is done, we have to import the library in Ride as shown in the below steps.

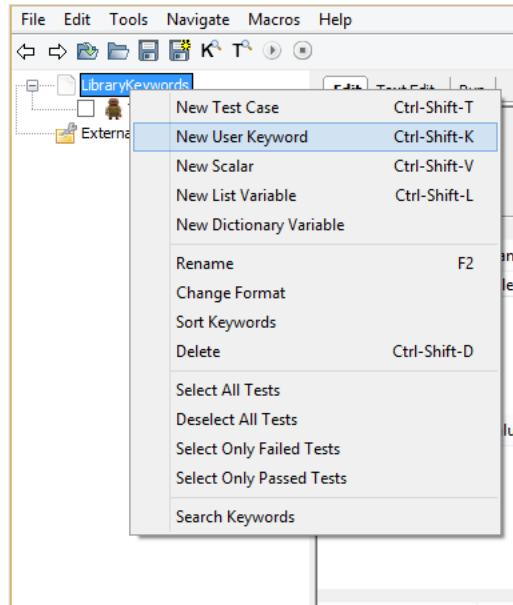

Selenium library gets installed inside the lib folder in python as follows:

## User-defined Keywords

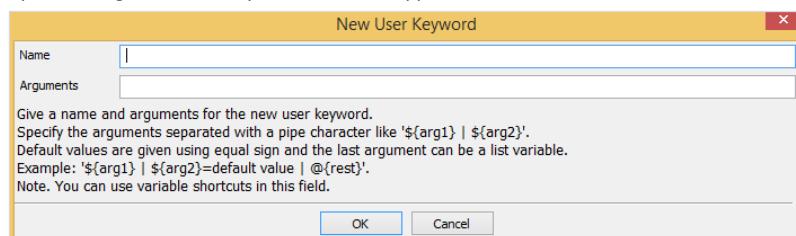

User-defined keywords can be created to perform a particular action in the test case or it can also be created using the library keywords and built-in keywords in robot framework. We will work on an example and see how we can create keywords for our test case.

We will use the same project that we created above and create user-defined keywords in that and use in the test case.

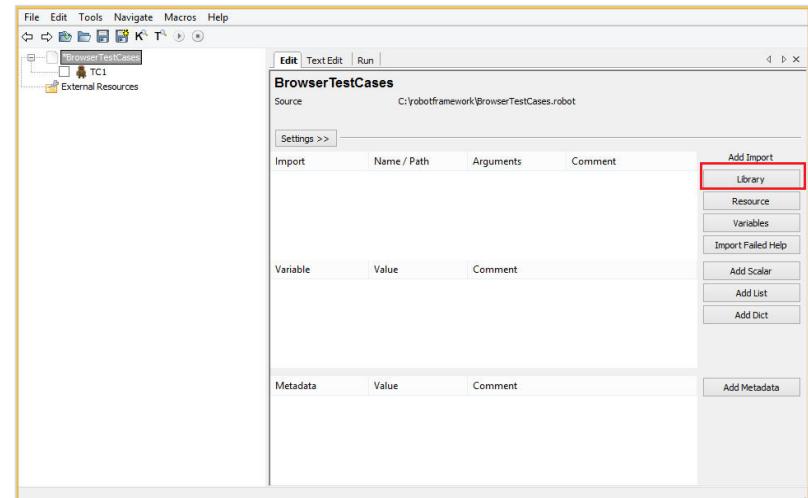

To create keyword in Ride, right-click on your project and click on *New User Keyword* as shown below:

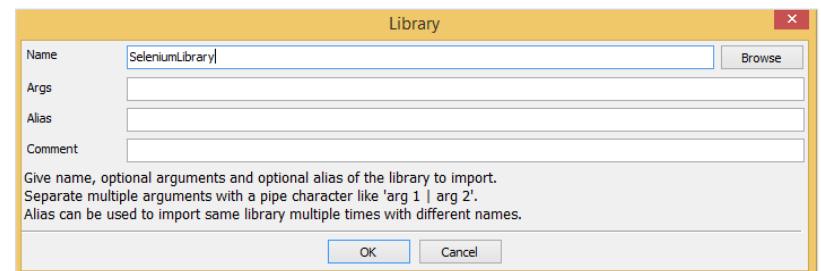

Upon clicking New User Keyword, a screen appears as shown below:

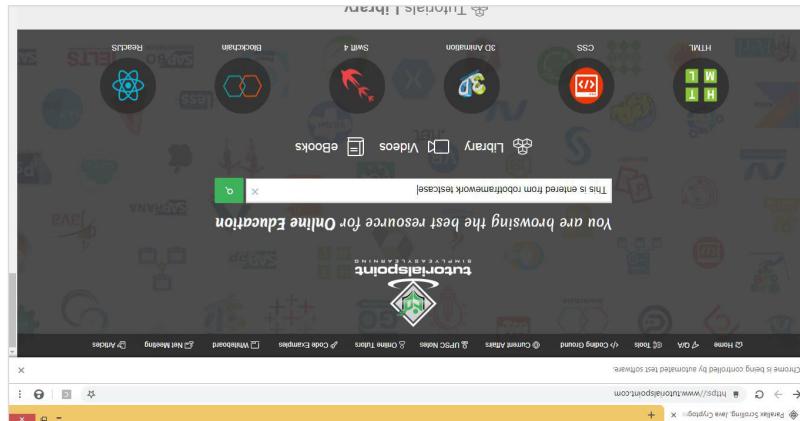

Click on your project on the left side and use Library from Add Import:

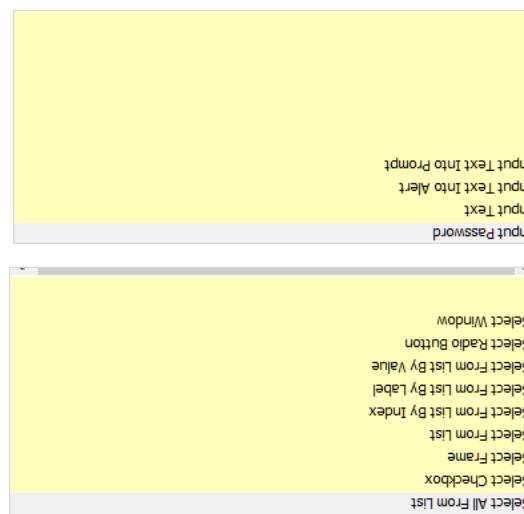

Upon clicking Library, a screen will appear wherein you need to enter the library name:

We have executed the test case. You can see the textbox has all the details we gave in the test case.

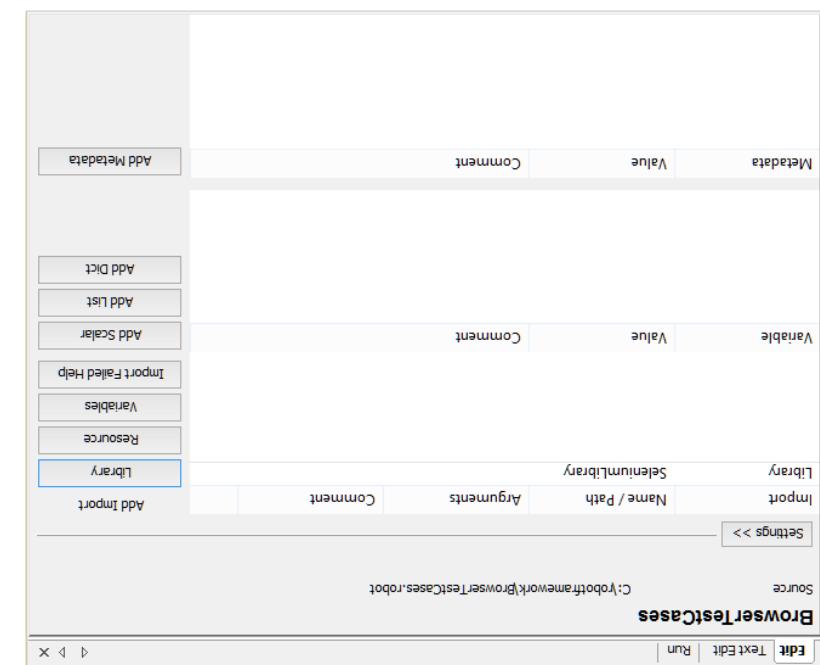

We will execute the test case we entered to open the browser with URL:

Robot

Robot  
OK and the library will get displayed in the settings.

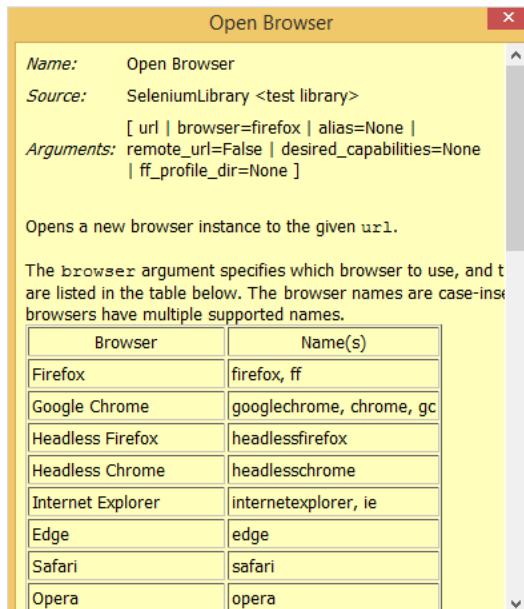

Robot

To get more details of this keyword, while typing the keyword press ctrl + spacebar. It will show the details of the library keyword entered.

Here is an example for Open Browser, and if any help required for that keyword you can make use of ctrl + spacebar while typing the keyword.

### Open Browser Keyword Details

Similarly, we have Library keywords to work with Input, Radio, Text, etc

Robot

The screenshot shows the 'BrowserTestCases' test case editor. It includes:

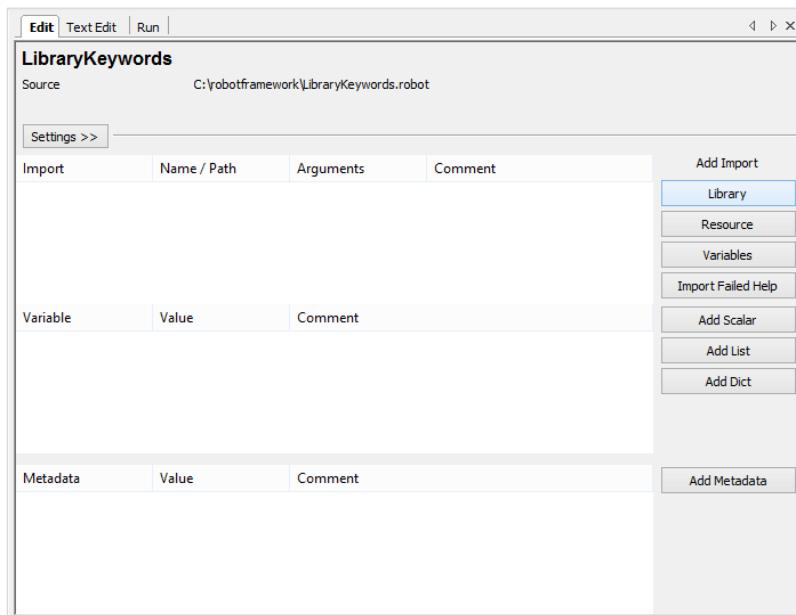

- Source:** C:\robotframework\BrowserTestCases.robot
- Imports:** SeleniumLibrary (highlighted in red)
- Variables:** seleniumlibrary (highlighted in red)
- Actions:** Add Import (Library, Resource, Variables, Import Failed Help), Add Scalar, Add List, Add Dict, Add Metadata

Library import in red is as good as the library does not exist inside python. Now, we have completed selenium library import.

## Robot

Click on your project on the left side and click Library.

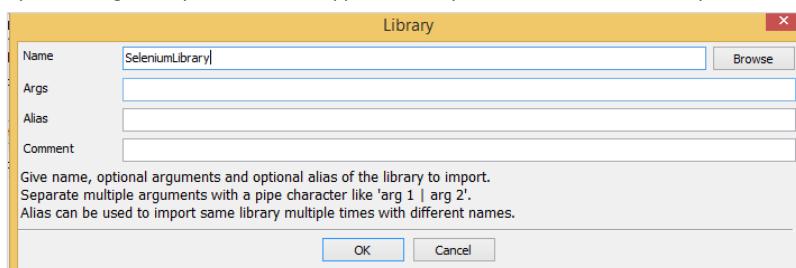

## Robot

In download section, go to *Third Party Browser Drivers NOT DEVELOPED* by seleniumhq and select Google Chrome driver as shown in highlighted section below:

Third Party Drivers, Bindings, and Plugins				
Selenium can be extended through the use of plugins. Here are a number of plugins created and maintained by third parties. For more information on how to create your own plugin or have it listed, consult the docs.				
Please note that these plugins are not supported, maintained, hosted, or endorsed by the Selenium project. In addition, be advised that the plugins listed below are not necessarily licensed under the Apache License v2.0. Some of the plugins are available under another free and open source software license; others are only available under a proprietary license. Any questions about plugins and their license of distribution need to be raised with their respective developer(s).				
<b>Third Party Browser Drivers NOT DEVELOPED</b> by seleniumhq				
Browser	Version	Last Change	Issue Log	Implementation Status
Mozilla GeckoDriver	latest	change log	issue tracker	selenium wiki page
<b>Google Chrome Driver</b>	latest	change log	issue tracker	selenium wiki page
Opera	latest	issue tracker	issue tracker	Implementation Status
Microsoft Edge Driver	(PhantomJS)	issue tracker	issue tracker	SeConf talk
GhostDriver	(PhantomJS)	issue tracker	issue tracker	issue tracker
HtmlUnitDriver	latest	issue tracker	issue tracker	issue tracker
SafariDriver		issue tracker	issue tracker	issue tracker
Windows Phone		issue tracker	issue tracker	issue tracker
Windows Phone	4.14.028.10	issue tracker	issue tracker	Released 2013-11-23
Selendroid - Selenium for Android		issue tracker	issue tracker	issue tracker
iOS-driver		issue tracker	issue tracker	issue tracker

Here we have a list of the various drivers available for browsers. For Chrome, click *Google Chrome Driver* and download the latest driver as per you operating system.

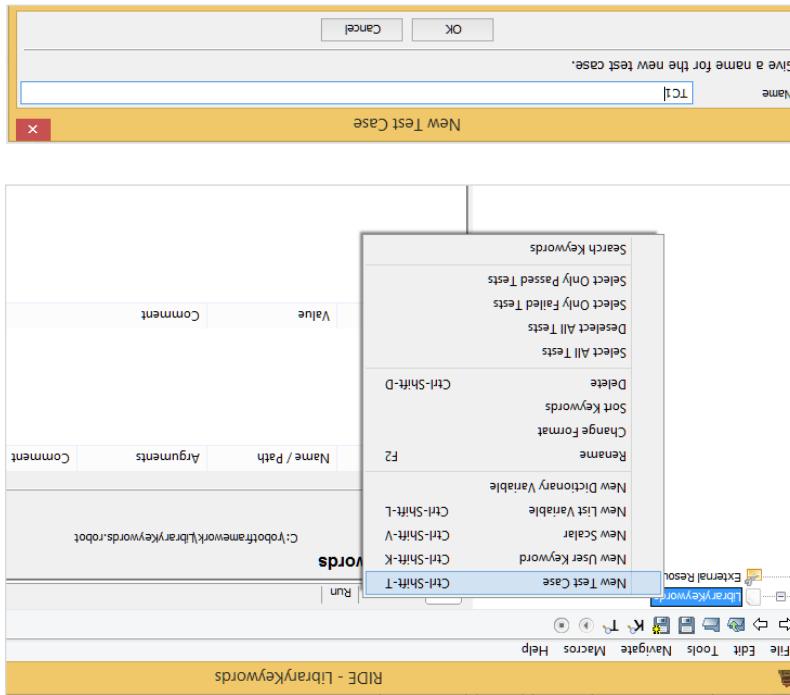

Upon clicking Library, a screen will appear where you need to enter the library name:

Click OK and the library will get displayed in the settings.

We are done with the project setup. Now, we will write test cases to show the working of our library keywords. Since we need Selenium library, we need to import the same in our project.

Give a name to the test case and click OK.

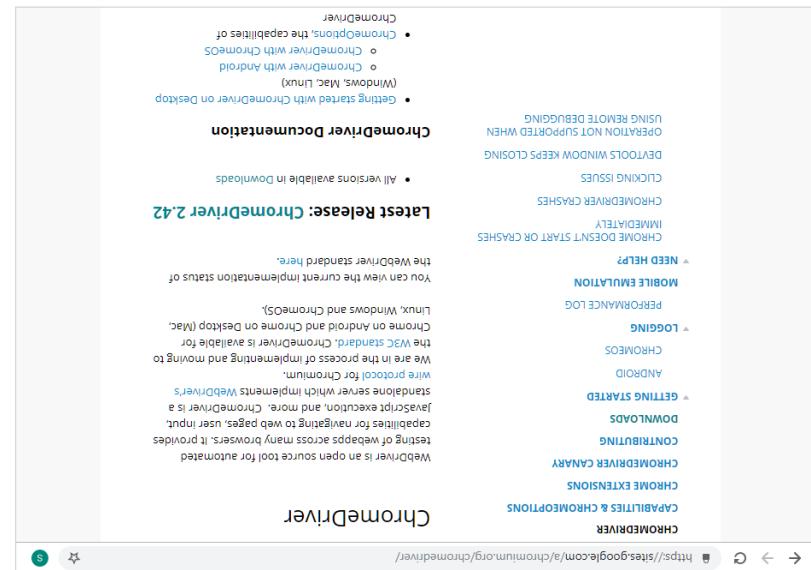

**Right-click** on the name of the project created and click on *New Test Case*:

Robot

Download the version as per your operating system from the above list. It downloads the zip file. Once the file is downloaded, unzip it and copy the .exe driver file to Python folder.

Name	Last modified	Size	ETag
Parent Directory	-	-	-

Click on the latest release. It will display the downloads as per the operating system – windows, linux and mac.

lobot

# 13. Robot Framework — Working With Keywords

Robot

In Robot Framework, test cases are constructed in test case tables using keywords. In this chapter, we will cover the details on keywords used in Robot Framework. There are 2 types of keywords used in Robot:

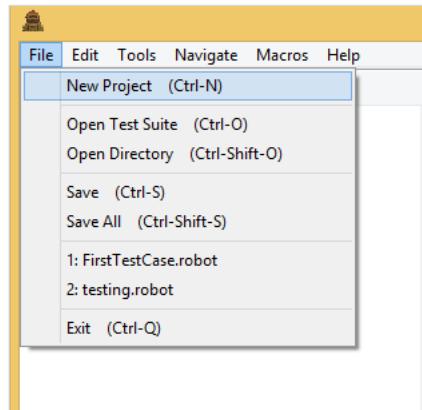

- Library Keywords
- User Defined Keywords

## Library Keywords

Library Keywords are keywords that come from the library we import in Robot Framework. We will now take a look at the Selenium library, which helps us interact with the browser. We will discuss some of the important keywords associated with selenium library.

Follow the steps shown below to import Selenium library:

The details relating to the installation of Selenium library is discussed in chapter “**Working with Browsers using Selenium Library**”. Open ride using **ride.py** from the command line.

Click on New Project and give name to your project. The name given to the project is **LibraryKeywords**.

We are copying the file to **C:\Python27\Scripts**.

Name	Date modified	Type	Size
chromedriver	13-09-2018 11:58	Application	6,546 KB
CreateBatchFiles	14-07-2011 21:30	Python File	2 KB
CreateMacScripts	Date created: 08-10-2018 14:49 Size: 6.39 MB	2011 21:30	Python File
easy_install	06-10-2018 16:10	Application	88 KB
easy_install-2.7	06-10-2018 16:10	Application	88 KB
idle	20-07-2008 13:22	ELI	1 KB

Now we are done installing the driver for chrome. We can get started with writing test case that will open browser and close browser.

Go back to ride and enter the keywords for opening the browser.

Ride helps you with keywords to be used with its built-in tool. Enter the command and press **ctrl+spacebar**. You will get all the details of the command as shown below:

A screenshot of the Ride application showing the 'Open' command expanded. The expanded view shows the 'Open' command followed by three examples of how to use it: 'Open Browser http://example.com Chrome', 'Open Browser http://example.com Firefox alias=Firefox', and 'Open Browser http://example.com Edge remote\_url=http://127.0.0.1:9999'. The examples are listed in a table-like structure with columns for the command, URL, browser, and additional parameters.

It gives the details of the command and also examples on how to use it. In the test case, we will open the site <https://www.tutorialspoint.com/> in chrome and the test case details will be as follows:

1	Open Browser	https://www.tutorialspoint.com/	chrome	
2				
3				
4				
5				
6				

We have seen how to work with dropdown by value, index and label. We can refer to logs and reports to get the details of the test case executed.

## Conclusion

### Test case details from log

## Log Details

The test case has passed! We can see the site is opened in chrome browser.

The screenshot shows a browser window with the following details:

- URL:** http://www.tutorialspoint.com/.../index.html
- Title:** Testing Page - Tutorialspoint
- Status Bar:** Status: Failed Run 1 / 1 failed
- Page Content:** A large red box highlights the text "Sorry, but we're having trouble reaching the server." Below it, a link says "Skip tests with these bugs".
- Test Results:** A table titled "Test results" shows one row with "Status: Failed" and "Run 1 / 1 failed".
- Test Log:** A detailed log of the test execution is visible on the right side of the browser window.

Let us now run this test case to see the output:

## Execution Details

```

Edit | Text Edit | Run
Execution Profile: pybot
Arguments:

Type:	<input type="radio"/> Critical Tests <input checked="" type="radio"/> All Tests		

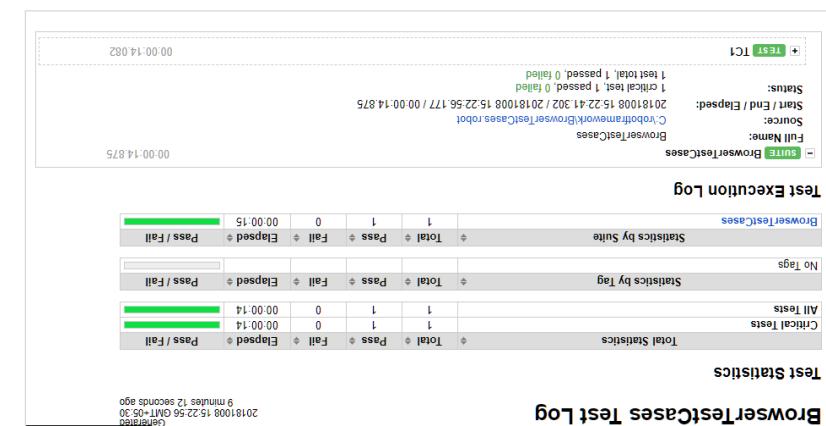

After execution, here is the selection done for dropdowns based on the test case:

	Open Browser	http://localhost/robotframework/dropdown
1	Select from List By Value	name:year
2	Select from List By Label	name:label
3	Select from List By Index	name:index
4	Select From List By Value	name:year
5	Select From List By Label	name:label
6	Select From List By Index	name:index
7		

If you want to select any year, take the value corresponding to the year and add the same in test case. For example, if you want to select year 2017 the value is 17.

Here is the final list of test cases:

```
<option value="12">2012</option>
<option value="13">2013</option>
<option value="14">2014</option>
<option value="15">2015</option>
<option value="16">2016</option>
<option value="17">2017</option>
<option value="18">2018</option>
</select>
```

Robot

Label is seen when you open the dropdown on screen.

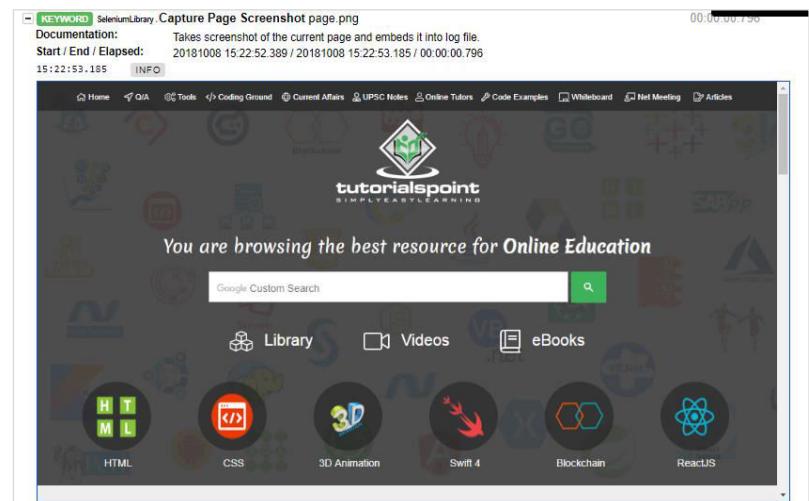

Dropdown By Index: Select Months. ▾

Dropdown By Label: 08 ▾  
Select Day..

15  
16  
17  
18  
19

Dropdown By Value: 02

### Details of test cases from log

- KEYWORD SeleniumLibrary.Open Browser https://www.tutorialspoint.com/, chrome  
Documentation: Opens a new browser instance to the given url.  
Start / End / Elapsed: 2018/08/15 22:42:095 / 2018/08/15 22:52:386 / 00:00:10.291  
15:22:42.095 INFO Opening browser 'chrome' to base url '<https://www.tutorialspoint.com/>'.

If you want to select a day, you can choose one from the dropdown.

### Select From List by Value

Here is the list of the year. The list has values from 0 to 18.

```
<select name="year">  
<option value="">Select year..</option>  
<option value="0">2000</option>  
<option value="1">2001</option>  
<option value="2">2002</option>  
<option value="3">2003</option>  
<option value="4">2004</option>  
<option value="5">2005</option>  
<option value="6">2006</option>  
<option value="7">2007</option>  
<option value="8">2008</option>  
<option value="9">2009</option>  
<option value="10">2010</option>  
<option value="11">2011</option>
```

129

86

### Details of test cases from log

- KEYWORD SeleniumLibrary.Close Browser  
Documentation: Closes the current browser.  
Start / End / Elapsed: 2018/08/15 22:53:185 / 2018/08/15 22:56:177 / 00:00:02.992

### Select List by Label - Example

Now, we want to select month as May so the index to be given in the test case is 5.

```

<select name="months">
  <option value="">Select Months.</option> // index 0
  <option value="Jan">January</option> // index 1
  <option value="Feb">February</option> // index 2
  <option value="Mar">March</option> // index 3
  <option value="Apr">April</option> // index 4
  <option value="May">May</option> // index 5
  <option value="Jun">June</option> // index 6
  <option value="Jul">July</option> // index 7
  <option value="Aug">August</option> // index 8
  <option value="Sep">September</option> // index 9
  <option value="Oct">October</option> // index 10
  <option value="Nov">November</option> // index 11
  <option value="Dec">December</option> // index 12
</select>
```

### Select List by Index - Example

For index, we need to pass the locator of that dropdown – name or id and the index of the element that needs to be selected.

We will add test cases for all 3 dropdown selection in Ride.

```

<body>
  </body>
</html>
```

### Select List by Label - Example

Now, we want to select month as May so the index to be given in the test case is 5.

We have seen how to install Selenium library and the browser drivers to work with browsers in Robot framework. Using the selenium library keywords, we can open any given link in the browser and interact with it. The details of the test-case execution are available in the form of reports and logs, which give the time taken for execution.

### Conclusion

1	2	3	4	5	6

Install the driver for Firefox and save it in python scripts folder.

### Test Case Using Firefox Browser

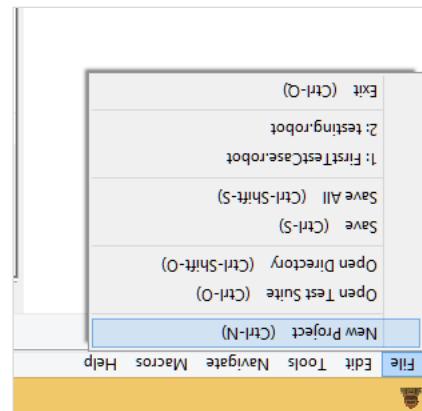

```
<option value="25">25</option>
<option value="26">26</option>
<option value="27">27</option>
<option value="28">28</option>
<option value="29">29</option>
<option value="30">30</option>
<option value="31">31</option>
</select>
</div>
<br/>
<br/>
<div>
Dropdown By Value:
<select name="year">
<option value="">Select year..</option>
<option value="0">2000</option>
<option value="1">2001</option>
<option value="2">2002</option>
<option value="3">2003</option>
<option value="4">2004</option>
<option value="5">2005</option>
<option value="6">2006</option>
<option value="7">2007</option>
<option value="8">2008</option>
<option value="9">2009</option>
<option value="10">2010</option>
<option value="11">2011</option>
<option value="12">2012</option>
<option value="13">2013</option>
<option value="14">2014</option>
<option value="15">2015</option>
<option value="16">2016</option>
<option value="17">2017</option>
<option value="18">2018</option>
</select>
</div>
</form>
```

Robot

Click **New Project** and enter Name of your project as shown below.

We will first create a project in Ride to work with browsers. Open ride using ride.py from

## Project Setup for TextBox Testing

- In this chapter, we will discuss the following areas:
    - Project Setup for Textbox Testing
    - Enter Data in Search TextBox
    - Click on Search Button

In this chapter, we will learn how to work with textboxes using Selenium WebDriver. To work with textboxes, we need to understand the basic concepts of Selenium WebDriver framework. In this chapter, we will learn how to work with textboxes using Selenium WebDriver. To work with textboxes, we need to understand the basic concepts of Selenium WebDriver framework.

9. Robot Framework – Working With Textbox

## Robot

For dropdown, *name* is the *locator*. In the above example, the *name* is *carbrand*. We also need the value so that we can select the same. The values in the above example are – *audi*, *bmw*, *chevrolet* and *datsun*.

Now, we will create a test page with dropdown, open the same in the browser and select the value from the dropdown.

The test case details will be as follows:

- Open browser: URL – <http://localhost/robotframework/dropdown.html> in chrome
- Enter details of dropdown
- Execute the test case

While writing the keyword for test cases in RIDE, press Ctrl + Spacebar. This gives all the details of the command.

For dropdown, we have three ways of doing it:

- Select From List By Index
- Select From List By Label
- Select From List By Value

We will work on an example to show working for all the cases mentioned above.

In our test page, we will create 3 dropdowns and will use above test cases to select the dropdown by index, label and value.

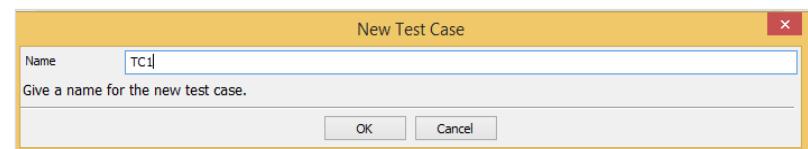

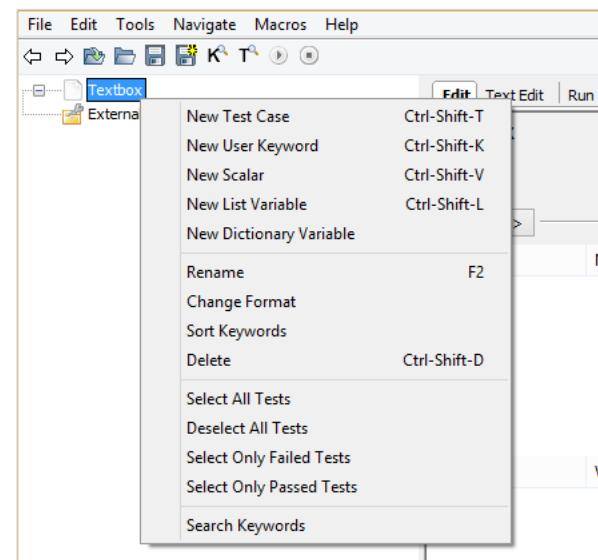

### dropdown.html

```
<html>
<head>
<title>Dropdown</title>
</head>
<body>
<form name="myform" method="POST">
<div>
Dropdown By Index:
<select name="months">
<option value="">Select Months.</option>
<option value="Jan">January</option>
<option value="Feb">February</option>
<option value="Mar">March</option>
<option value="Apr">April</option>
<option value="May">May</option>
<option value="Jun">June</option>
<option value="Jul">July</option>
```

125

## Robot

The name given for the project is *Textbox*. Click OK to save the project. Right-click on the name of the project created and click on *New Test Case*:

Name your test case and click OK to save it. We are now done with the project setup. Further, we will write test cases for the textbox. Since we need Selenium library, we need to import the same in our project.

```

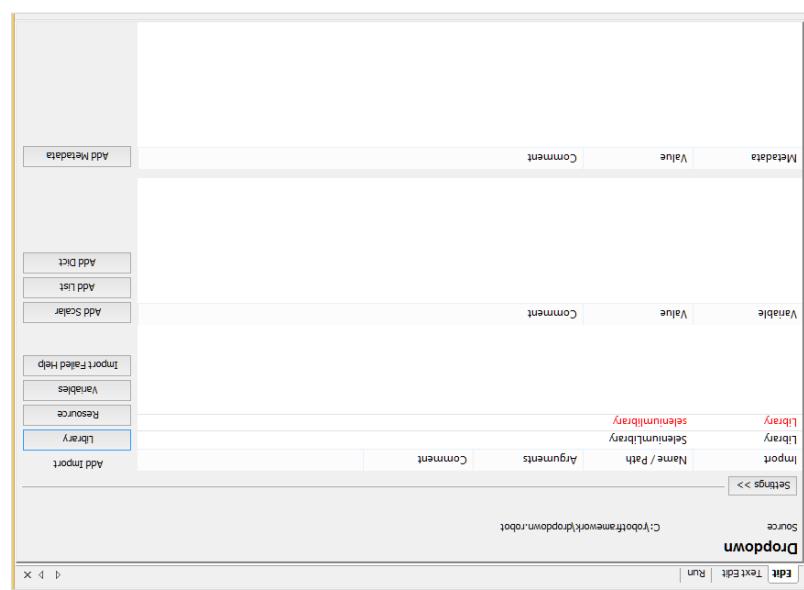

<select name="carbrand">
    <option value="">Select car brand..</option>
    <option value="audi">audi</option>
    <option value="bmw">BMW</option>
    <option value="chevrolet">CHEVROLET</option>
    <option value="datsun">DATSUN</option>
</select>
```

Consider the following html display for dropdown:

The test case for dropdown will select the value from the dropdown. To go about working with this, we need the locator (id/locator) for that dropdown.

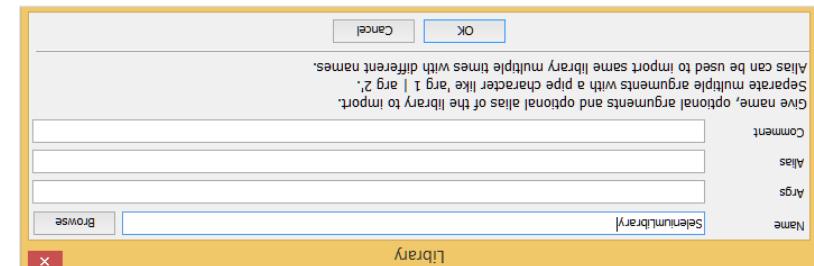

## Test Case for Dropdown

Library import in red is as good as the library does not exists inside python. So now we are done with selenium library import.

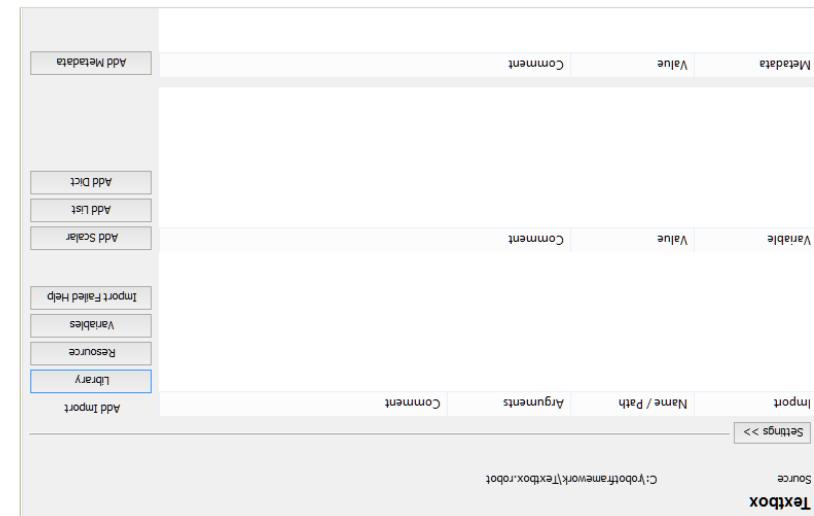

In case the name does not match, the library name will show in red:

Robot

Upon clicking library, a screen will appear where you need to enter the library name:

Click on your project on the left side and use Library from Add Import.

Robot

Robot

Click OK and the library will be displayed in the settings.

The screenshot shows the 'Dropdown' configuration screen in the Robot Framework interface. It includes sections for 'Import', 'Library', 'Variable', and 'Metadata'. On the right side, there is a sidebar with buttons for 'Add Import' (Library, Resource, Variables), 'Import Failed Help', and 'Add Metadata'.

The name given has to match with the name of the folder installed in site-packages.

Robot

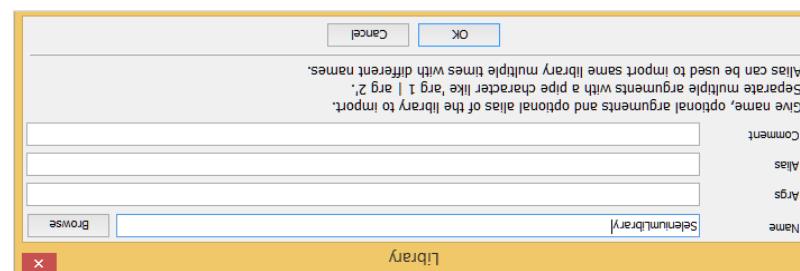

Click OK and the library will get displayed in the settings.

The screenshot shows the 'BrowserTestCases' configuration screen in the Robot Framework interface. It includes sections for 'Import', 'Library', 'Variable', and 'Metadata'. On the right side, there is a sidebar with buttons for 'Add Import' (Library, Resource, Variables), 'Import Failed Help', and 'Add Metadata'.

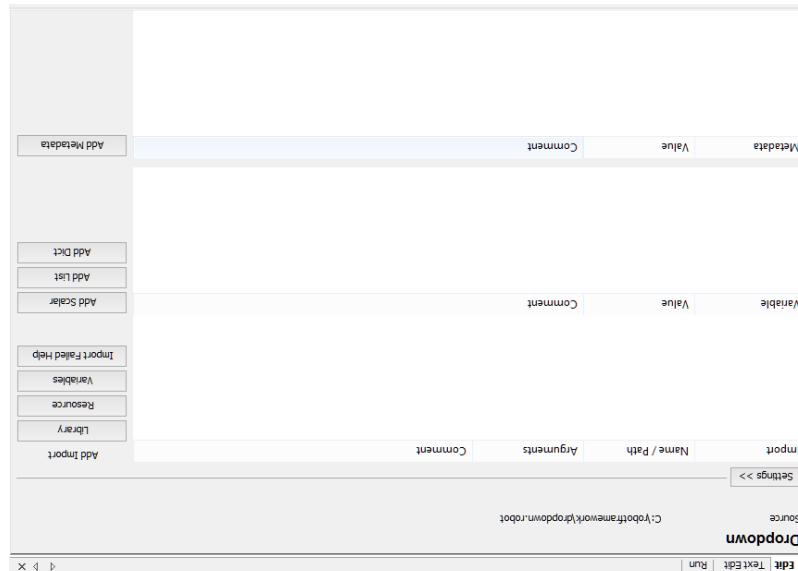

The name given has to match with the name of the folder installed in site-packages.

- **class** of the textbox, it will be `class:classname` or `class=classname`
- **id** of the textbox, it will be `id:idoftextbox` or `id=idoftextbox`
- **name** attribute of the textbox, it has to be `name:Nameofthetextbox` or `name=Nameofthetextbox`

To work with textbox, we need a locator. A locator is the identifier for the textbox like id, name, class, etc. For example, if you are using the

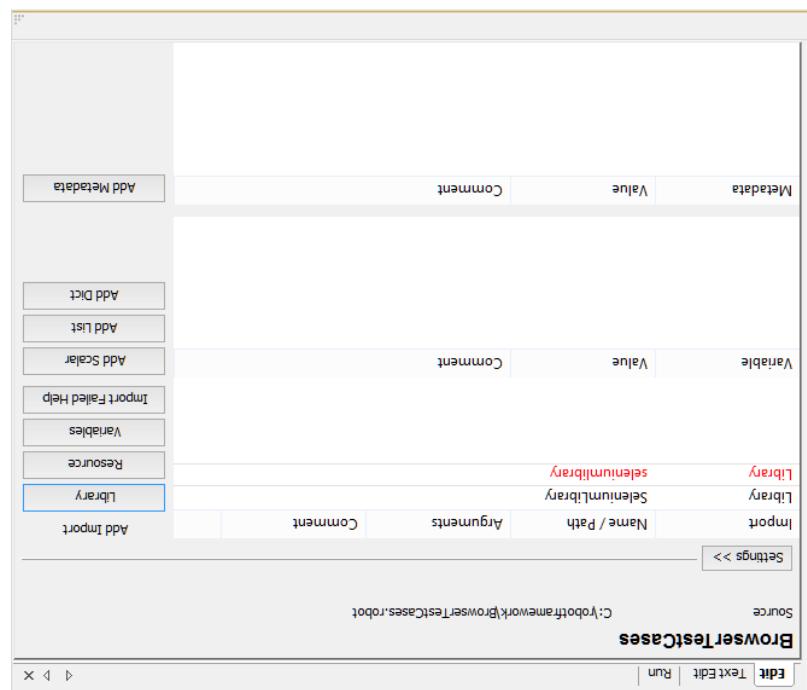

Now, click Library. A screen will appear where you need to enter the library name:

Click on your project on the left side and use Library from Add Import as shown below:

Robot

- We are now going to write test cases. The test case details will be as follows:
- Open browser: URL - <https://www.tutorialspoint.com/> in Chrome  
Enter data in the search textbox in <https://www.tutorialspoint.com/>  
Click Search

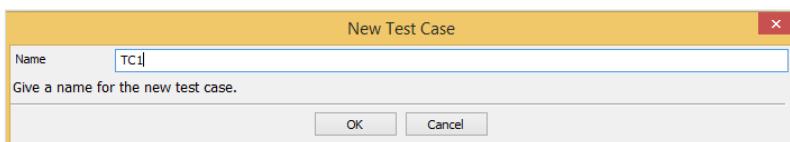

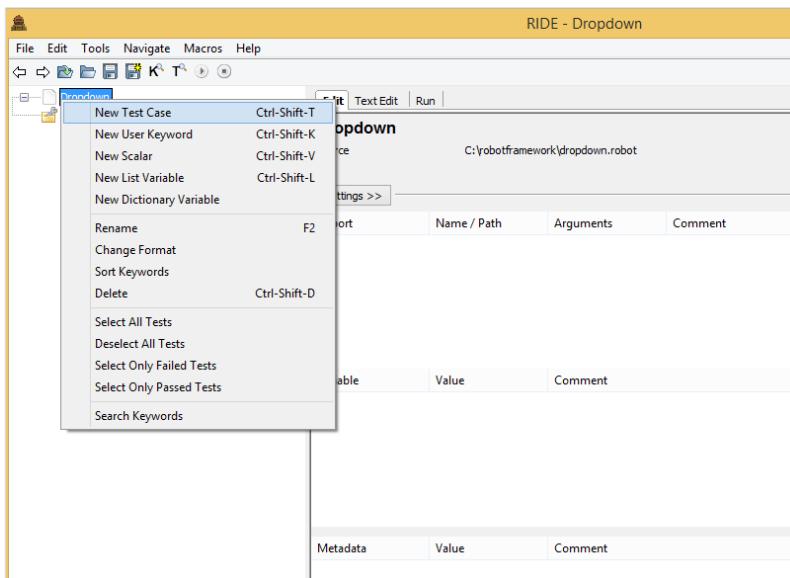

In case the names do not match, the library name will show in red as in the following screenshot:

Robot

Robot

Right-click on the name of the project created and click *New Test Case*:

Give name to the test case and click OK to save it.

We are done with the project setup. Now, we will write test cases for the dropdown. Since we need Selenium library, we need to import the same in our project.

121

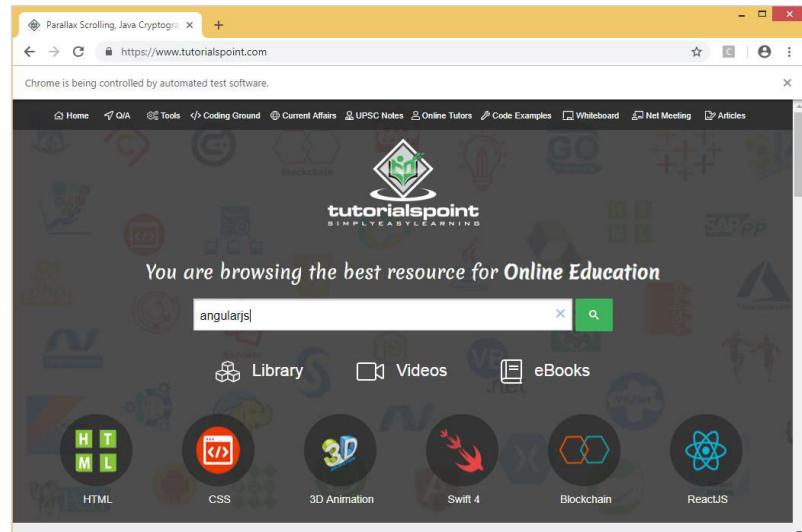

Robot

Now, we will add the details of the test case for textbox in ride. Here are the keywords entered for textbox test case:

	Name / Path	Arguments	Comment
1	Open Browser	https://www.tutorialspoint.com/	chrome
2	Input Text	name:search	angularjs
3	Click Button	class:gsc-search-button-v2	
4			
5			

- **Open Browser:** The keyword opens the browser for the given URL and the browser specified.
- **Input Text:** This keyword works on the input type and will look for the locator name:search on the site <https://www.tutorialspoint.com/> and angularjs is the value we want to type in the textbox.
- **Click button** is used to click on the button with location class:gsc-search-button-v2.

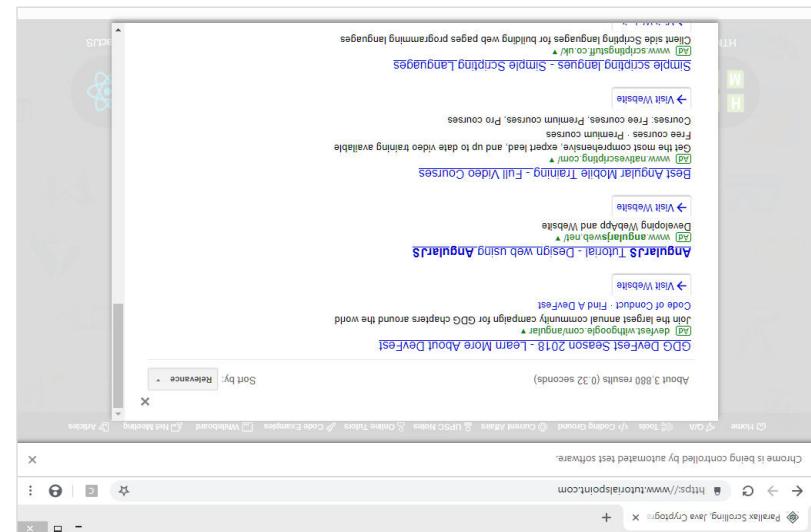

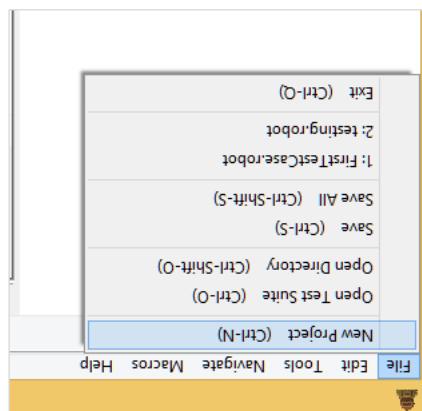

We will now execute the same:

The name given is dropdown. Click OK to save the project.

Click New Project and give a name to your project.

Upon clicking the Search icon, a screen will appear as shown in the following screenshot:

Robot

## 12. Robot Framework — Working With Dropdown

In this chapter, we will learn how to work with dropdown using Selenium library.

We will first create a project in RIDE to work with browsers. Open ride using **ride.py** from the command line:

### Project Setup for Dropdown Testing

Upon clicking the Search icon, a screen will appear as shown in the following screenshot:

-	<b>SUITE</b>	Checkbox
Full Name:	Checkbox	
Source:	C:\robotframework\checkbox.robot	
Start / End / Elapsed:	20181014 10:18:08.740 / 20181014 10:18:14.588 / 00:00:05.848	
Status:	1 critical test, 1 passed, 0 failed 1 test total, 1 passed, 0 failed	
-	<b>TEST</b>	TC1
Full Name:	Checkbox.TC1	
Start / End / Elapsed:	20181014 10:18:09.501 / 20181014 10:18:14.584 / 00:00:05.083	
Status:	PASS (critical)	
-	<b>KEYWORD</b>	SeleniumLibrary Open Browser http://localhost/robotframework/checkbox.html, chrome
Documentation:	Opens a new browser instance to the given url.	
Start / End / Elapsed:	20181014 10:18:09.517 / 20181014 10:18:14.130 / 00:00:04.613 10:18:09.517 [INFO] Opening browser 'chrome' to base url ' <a href="http://localhost/robotframework/checkbox.html">http://localhost/robotframework/checkbox.html</a> '.	
-	<b>KEYWORD</b>	SeleniumLibrary Select Checkbox name:option1
Documentation:	Selects checkbox identified by locator.	
Start / End / Elapsed:	20181014 10:18:14.132 / 20181014 10:18:14.582 / 00:00:00.450 10:18:14.134 [INFO] Selecting checkbox 'name:option1'.	

## Conclusion

In this chapter, we learnt how we can select a checkbox by giving the locator of the checkbox. The log and Reports give the details of the execution of the test case along with the time spent for each test case.

Let us now see the reports and the log details:

## Report

```

The name given is RadioButton. Click on OK button to save the project.

Click New Project and enter Name of your project as shown in the screenshot below.

## Project Setup For TextBox Testing

- Project Setup for RadioButton Testing
- Test case for RadioButton Button

We are going to discuss the following over here:

In this chapter, we will learn how to work with radio button using Selenium Library. To work with radio button, we need the locator - the main unique identifier for that radio button. For testing, it becomes important to understand how to interact with the browser and locate the html elements. It is very easy to work with input fields with robot framework.

This is how the URL is:

localhost/robotframework/checkbox.html

How would you like to travel?

<input type="radio"/>	Always
<input type="radio"/>	Train
<input type="radio"/>	Bus
<input type="radio"/>	Car

checkbox.html

Given in the above form, we are planning to select Car, which is a checkbox. The details are given in the test case. Now, we will execute the test case and check the selection of the checkbox for the above form.

In the above form, we are planning to select Car, which is a checkbox. The details are given in the test case. Now, we will execute the test case and check the selection of the checkbox for the above form.

99

116

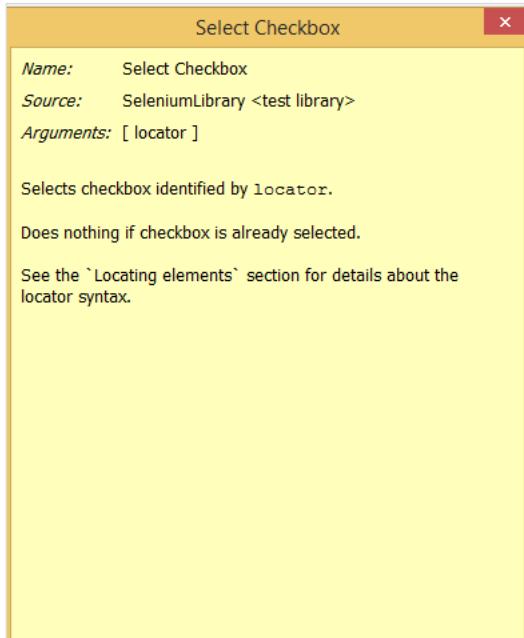

```
<html>
<head>
<title>Checkbox Test Page</title>
</head>
<body>
<form name="myform" method="POST">
<b>How would you like to travel?</b>
<br>
<input type="checkbox" name="option1" value="Car"> Car<br>
<input type="checkbox" name="option2" value="Bus"> Bus<br>
<input type="checkbox" name="option3" value="Train"> Train<br>
<input type="checkbox" name="option4" value="Air"> Airways<br>
</form>
</body>
</html>
```

While writing the keyword for test cases, press Ctrl + Spacebar. It gives all the details of the command.Details of checkbox.

The keywords to be used for checkbox is:

```
Select checkbox name:nameofcheckbox value
```

The command details from ride is as follows:

So, arguments is the locator for the checkbox. Here are the details of the test case for Checkbox selection:

1	Open Browser	http://localhost/robotframework/d/chrome		
2	Select Checkbox	name:option1		
3				
4				
5				
6				
7				

- Open browser: URL - <http://localhost/robotframework/checkbox.html> in Chrome
  - Enter details of checkbox.
  - Execute the test case.
- The test case details will be as follows:

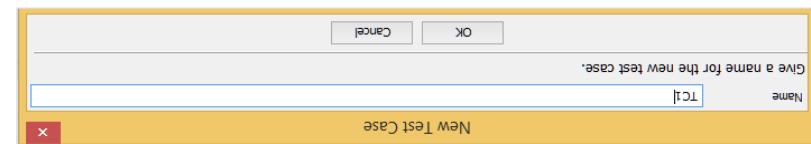

Now, we will create a test page with checkbox. Open the checkbox in the browser and select the value.

For checkbox, we have the name as the locator. In the above example, the name is option1. We also need the value so that we can select the same. Car holds the value in checkbox, we have the name as the locator.

```
<input type="checkbox" name="option1" value="Car"> Car
```

Now consider the following html display for checkbox:

Give name to the test case and click OK to save it. We are done with the project setup and import the same in our project.

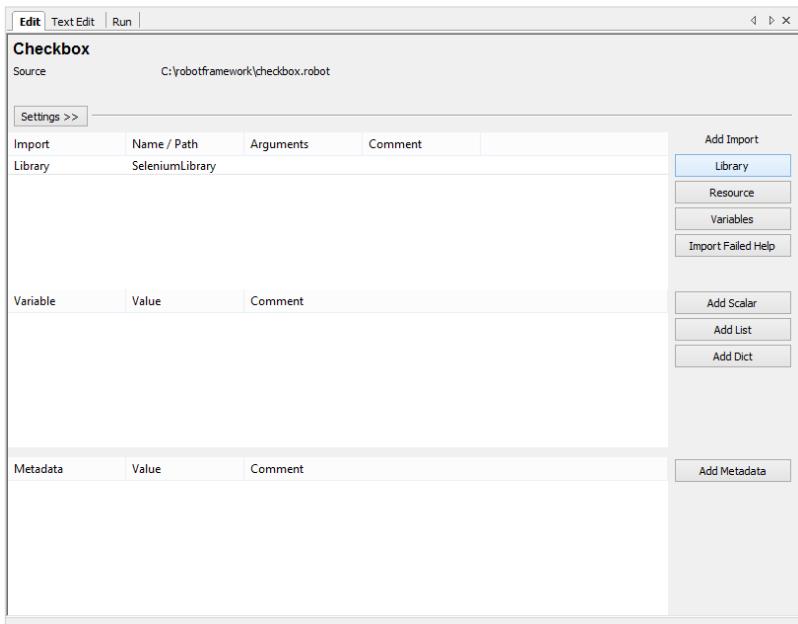

Right-click on the name of the project created and click on **New Test Case**:

Robot

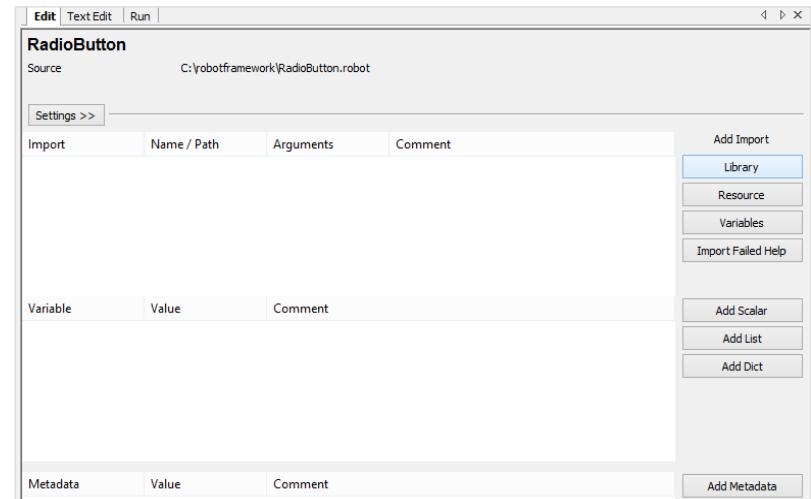

The name given has to match with the name of the folder installed in site-packages. If the names do not match, the library name will show in red:

Robot

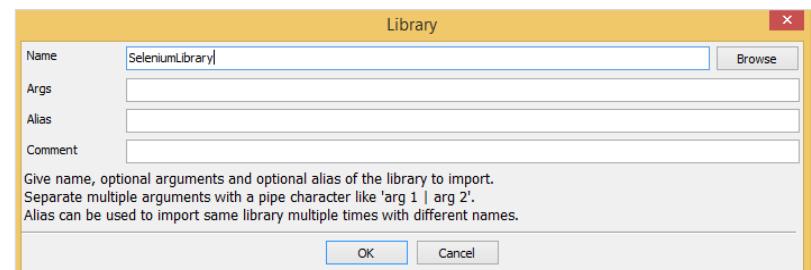

## Robot

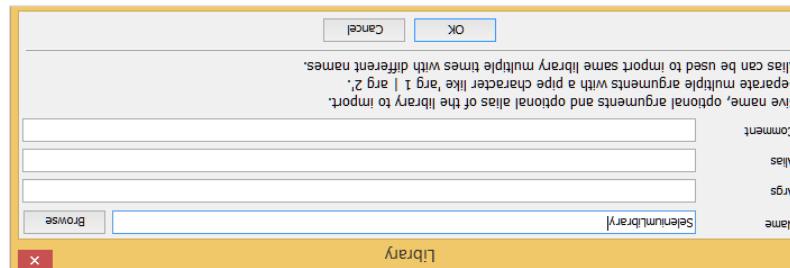

Click on your project on the left side and use *Library* from Add Import.

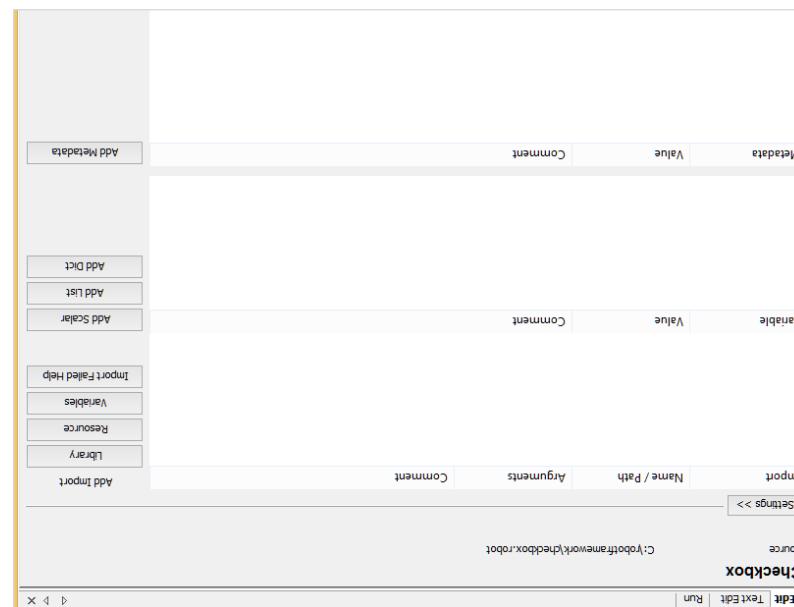

Upon clicking Library, a screen will appear where you need to enter the library name:

Click OK and the library will get displayed in the settings.

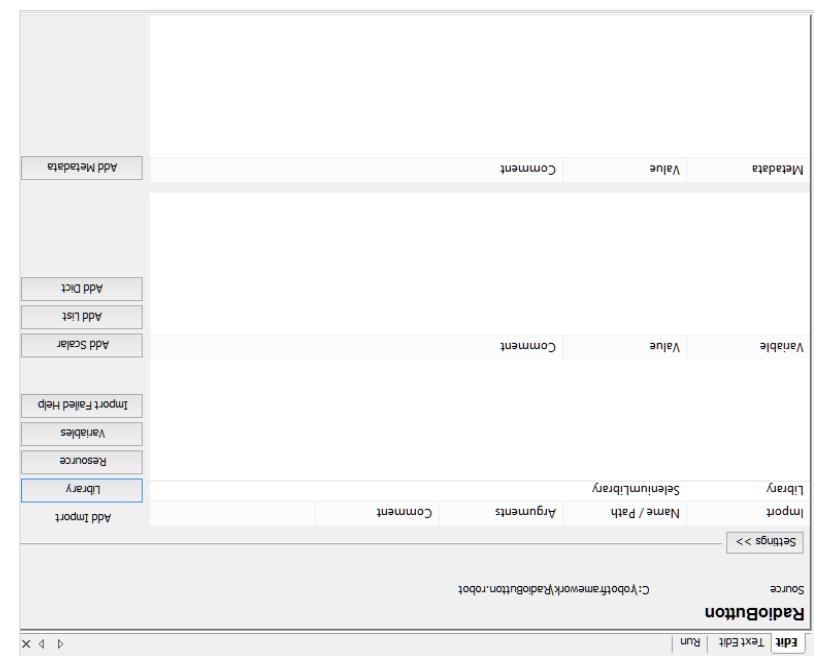

Now, click Library. A screen will appear where you need to enter the library name:

Click on your project on the left side and use Library from Add Import.

Robot

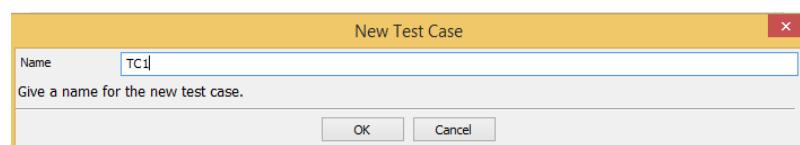

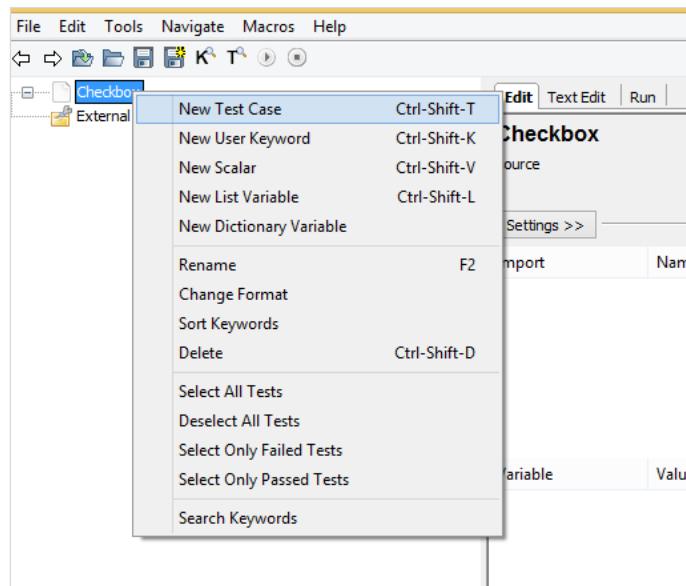

Click OK and the library will be displayed in the settings.

Robot

Robot

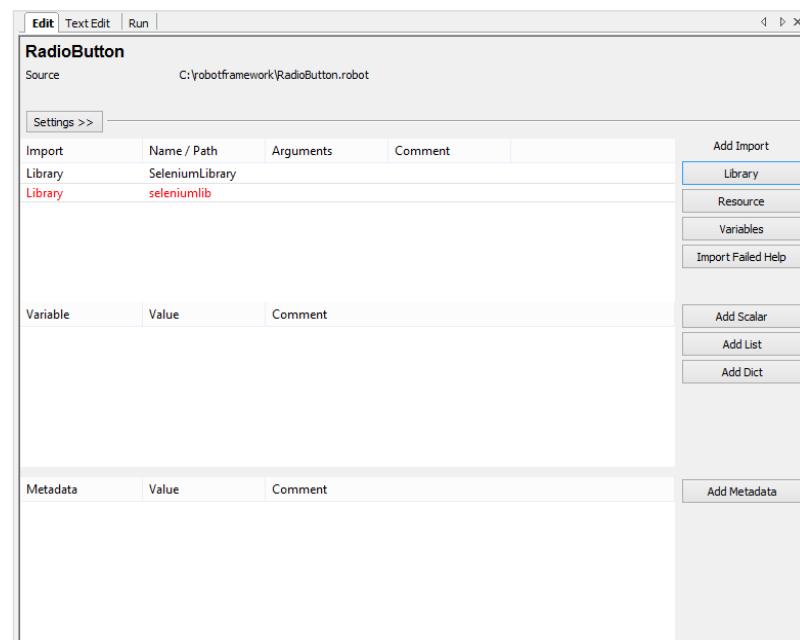

Right-click on the name of the project created and click *New Test Case*:

Give name to the test case and click OK. We are done with the project setup. Now we will write test cases for checkbox. Since we need Selenium library, we need to import the same in our project.

Robot

The name given has to match with the name of the folder installed in site-packages. If the name does not match, it will be in red as shown below:

## Test Case for Radio Button

The radio button test case will select a radio button, with the help of a locator.

Consider the following html display for radio button:

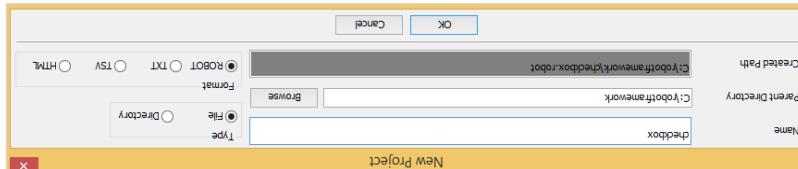

```
<input type="radio" name="gender" value="male" checked> Male<br/>
<input type="radio" name="gender" value="female"> Female<br/>
```

For radio button, *name* is the locator. In the above example, the *name* is *gender*. We also need the *value* so that we can select the radio button we want. The values in the above example are *Male* and *Female*.

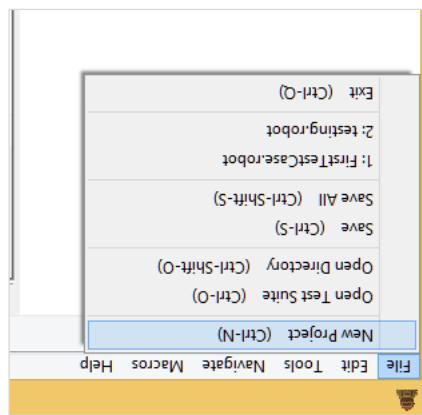

Now, we will create a test-page with radio button and open the same in the browser. Now, select the value of the radio button. The test case details will be as follows:

- Open browser: URL – <http://localhost/robotframework/radiobutton.html> in chrome
- Enter details of radio button

The name given for the project is Checkbox. Click OK to save the project.

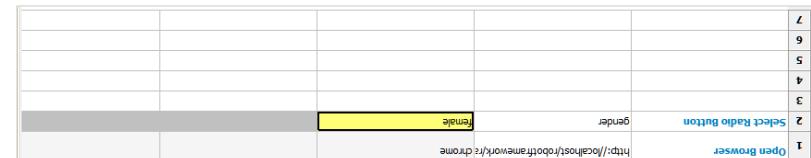

Click on New Project and enter Name of your project as shown in the screenshot below.

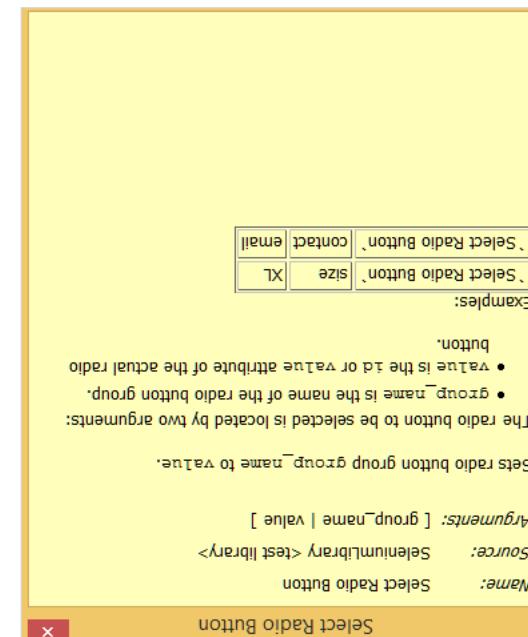

We will first create a project in RIDE to work with browsers. Open ride using `ride.py` from the command line.

### Project Setup for Checkbox Testing

For testing, it becomes important to understand how to interact with the browser and locate the html elements. It is very easy to work with input fields with robot framework. In this chapter, we will learn how to work with checkbox using Selenium Library. To work with checkbox, we need the locator, which is the main unique identifier for that checkbox. The locator can be id, name, class, etc.

For the radio button, the arguments are group name and value. Here are the details of the test case for Radio button selection:

- value is the id or value attribute of the actual radio button.
- group\_name is the name of the radio button group.

The radio button to be selected is located by two arguments:

Sets radio button group group\_name to value.

Arguments: [group\_name | value ]

Source: SeleniumLibrary <test library>

Name: Select Radio Button

## 11. Robot Framework – Working With Checkbox

While writing the keyword for test cases, press Ctrl + Spacebar. You will get the details of the command. Details of Radio button:

Robot

- Execute the test case

## Details of test cases

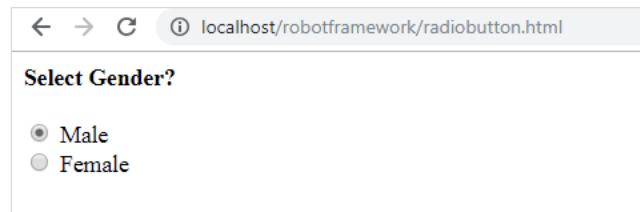

### Test Execution Log

<b>SUITE</b>	RadioButton
Full Name:	RadioButton
Source:	C:\robotframework\RadioButton.robot
Start / End / Elapsed:	20181014 10:37:06.590 / 20181014 10:37:13.950 / 00:00:07.360
Status:	1 critical test, 1 passed, 0 failed 1 test total, 1 passed, 0 failed
<b>TEST</b>	TC1
Full Name:	RadioButton TC1
Start / End / Elapsed:	20181014 10:37:07.456 / 20181014 10:37:13.946 / 00:00:06.490
Status:	<b>PASS</b> (critical)
<b>KEYWORD</b>	Open Browser http://localhost/robotframework/radiobutton.html, chrome
Documentation:	Opens a new browser instance to the given url.
Start / End / Elapsed:	20181014 10:37:07.459 / 20181014 10:37:13.498 / 00:00:06.039
10:37:07.461	INFO Opening browser 'chrome' to base url ' <a href="http://localhost/robotframework/radiobutton.html">http://localhost/robotframework/radiobutton.html</a> '.
<b>KEYWORD</b>	Select Radio Button gender, female
Documentation:	Sets radio button group group_name to value.
Start / End / Elapsed:	20181014 10:37:13.500 / 20181014 10:37:13.944 / 00:00:00.444
10:37:13.502	INFO Selecting 'female' from radio button 'gender'.

## Conclusion

We have seen how to select value of radio button by giving the group name of the radio button to the test case. Using the keywords available with robot framework and the library imported, we can locate the radio button and select the value of the radio button. We do get the details of the test-case executed using robot framework logs and report.

Following is the Test Page for radio button:

Html code for Radiobutton.html

```
<html>
<head>
<title>Radio Button</title>
</head>
<body>
<form name="myform" method="POST">
<b>Select Gender?</b>
<div><br/>
<input type="radio" name="gender" value="male" checked> Male<br/>
<input type="radio" name="gender" value="female"> Female<br/>
</div>
</form>
</body>
</html>
```

In the above form, we are planning to select *female*, which is a radio button. The name and value are given in the test case. Now, we will execute the test case and check the selection of the checkbox for the above form.

Robot

## Radio Button Test Report

### Report Details

Summary Information

Status:	All tests passed
Start Time:	20181014 10:37:13.590
End Time:	20181014 10:37:13.590
Elapsed Time:	00:00:00.00
Log File:	log.html

When the test case is executed, it opens the URL <http://localhost/roottframework/radiobutton.html> and selects the Female radio button whose name and value we have given in the test case.
